

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

- + *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.
- + *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.
- + *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.
- + *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at <http://books.google.com/>

W. J. -

For the

PREFACE.

The preparation of the *American Ephemeris and Nautical Almanac* was begun in the latter part of the year 1849, in accordance with an act of Congress, approved on the 3d of March of that year. Changes of detail have from time to time been introduced into the work, but the general plan has remained unaltered.

In the present volume ten fundamental time-stars have been added to the list, to fill gaps; the right ascensions of the time-stars have been corrected from a new investigation; and the declinations of the whole list are from a paper by Mr. LEWIS BOSS, now in press. No other important change has been made. Extensive changes are however to be made in the volume for the year 1882, including a considerable extension of the star list for the use of field observers.

An account of the data employed in the preparation will be found in the Appendix.

A supplement contains tables for finding the latitude of a place by altitudes of the pole-star.

SIMON NEWCOMB,

Professor U. S. Navy, Superintendent.

WASHINGTON, July 16, 1878.

EPHEMERIS FOR 1880, (first edition.)

Page 259, right ascension of α Eridani, $1^h 33^m$,	for $4^s.366$	read $14^s.366$
260, β Leonis, $11^h 42^m$, magnitude,	for 3	read 2
261, β Libræ, $15^h 10^m$, magnitude,	for 4.3	read 2
261, μ' Bootis, $15^h 19^m$, magnitude,	for 2	read 4.3
262, right ascension of 12 Year Cat. 1879,	for $20^h 53^m$	read $20^h 52^m$
262, declination of β Aquarii, $21^h 25^m$,	for $-6^\circ 6'$	read $-6^\circ 5'$
262, declination of θ Aquarii, $22^h 10^m$,	for $-8^\circ 2'$	read $-8^\circ 22'$
262, declination of π Aquarii, $22^h 19^m$,	for $+0^\circ 4'$	read $+0^\circ 46'$
266, 267, 268, increase right ascensions of 51 Cephei one minute.		
283, right ascension of β Orionis, Dec. 34.4,	for $52^s.44$	read $51^s.44$
299, declination of θ Bootis, Dec. 34.8,	for $44''.4$	read $43''.4$
318, right ascension of β Cephei,	for $21^h 17^m$	read $21^h 27^m$
321, right ascension of 226 Cephei,	for 23^h	read 22^h
333, declination of ζ Tauri, $5^h 30^m$,	for $3' 50'' 4$	read $4' 4'' 5$
333, declination of ζ Tauri, annual variation,	for $1''.73$	read $2''.56$
334, No. 63,	for ζ^1	read ζ
334, α^1 Cancri, $8^h 36^m$, magnitude,	for 4	read 6
334, δ Cancri, $8^h 37^m$, magnitude,	for 6	read 4
334, declination of B. A. C. 3726, $10^h 46^m$,	for $41''.3$	read $49''.3$
334, last line,	for $+20''.11$	read $-20''.11$
335, No. 120,	for 4 Virginis	read ψ Virginis
336, No. 178,	for α Sagittarii	read α Sagittarii
336, No. 204,	for κ^1 Capricorni	read c^1 Capricorni
336, right ascension of ω Piscium, $23^h 53^m$,	for $18^s.99$	read $8^s.99$
341, line seventeen from bottom,	for page 250	read page 248
385, app. R. A. for meridian transit, Dec. 17,	for $54^s.57$	read $54^s.52$
472,	for December	read December
483, The apparent discs of Venus and Mars,	for 1879	read 1880
489, next to last line,	for B. A. C. 4351	read B. A. C. 4531
497, line fifteen from bottom,	for June	read June
501, middle of page,	dele Such a table is given in the Appendix.	
510, line eight,	for geoeentric	read geocentric
511, line ten from bottom,	for $(54)=(27)+(28)$	read $(54)=(27)+(53)$

APPENDIX.

9, reduction for $11^h 38^m$,	for $1^m 54^s.531$	read $1^m 54^s.351$
9, reduction for 14^s ,	for 0.38	read .038
9, reduction for 15^s ,	for 0.41	read .041
9, reduction for $15^h 59^m$,	for $2^m 36^s.109$	read $2^m 37^s.109$
10, reduction for $16^h 58^m$,	for $2^m 46^s.755$	read $2^m 46^s.775$
19, right ascension $9^h 23^m$,	for α Ursæ Majoris	read d Ursæ Majoris
21, last line, σ Octantis,	for $-3^s.61 -4^s.28$	read $+3^s.61 +4^s.53$

SUPPLEMENT.

(1), line eight,	for $\sin^4 t \tan^3 h$	read $\sin^4 t \tan^3 h$
(1), line twelve,	for t —the hour angle	read t —the hour angle
(1), line thirteen,	for $1^\circ 20''$	read $1^\circ 20'$
(1), line twelve from bottom,	for Rednce	read Reduce
(2), line four,	for giving it to	read giving to it
(4), (5), (6), Table C, $88^\circ 40' 10''$,	for $-0''.2 +0''.2$	read $0''.2 -0''.2$
(8), Table C, column B,	for $1^m 0''$	read $1' 0''$
(9), headings of columns,	for $88^\circ 40'$ $88^\circ 41'$	read $88^\circ 39'$ $88^\circ 40'$
(10), $A=56'$, declination $=88^\circ 41' 0''$,	for $41''.0$	read $42''.0$

EPHEMERIS FOR 1881, (first edition.)

22, February 28, last column,	for $59^s.83$	read $59^s.83$
202, December 7, last column,	for $27^s.59$	read $17^s.59$

CHRONOLOGICAL ERAS AND CYCLES.

CHRONOLOGICAL ERAS.

THE YEAR 1881, WHICH COMPRISES THE LATTER PART OF THE 105TH AND THE BEGINNING OF THE 106TH YEAR OF THE INDEPENDENCE OF THE UNITED STATES OF AMERICA, CORRESPONDS TO—

The year 6594 of the Julian period;

- “ 7389-90 of the Byzantine era, the year 7390 commencing on September 1;
- “ 5641-42 of the Jewish era, the year 5642 commencing in September;
- “ 2634 since the foundation of Rome, according to VARRO;
- “ 2628 since the beginning of the era of NABONASSAR, which has been assigned to Wednesday, the 26th of February, of the 3967th year of the Julian Period, corresponding according to the reckoning of chronologists to the 747th, and according to the astronomers to the 746th year before the birth of CHRIST.
- “ 2657 of the Olympiads, or the first year of the 665th Olympiad, commencing in July, 1881, if we fix the era of the Olympiads at 775½ years before CHRIST or near the beginning of July of the year 3938 of the Julian Period;
- “ 2193 of the Grecian era, or the era of the Seleucidæ;
- “ 1597 of the Era of DIOCLETIAN.

The year 1299 of the Mohammedan era, or the era of the Hegira, begins on the 23d day of November, 1881.

The first day of January of the year 1881 is the 2,408,082nd day since the commencement of the Julian Period.

NOTE.—Mean Time of the Semidiameter passing may be found by subtracting 0.18 from the Sidereal Time.

+ prefixed to the hourly change of declination indicates that the south declinations are decreasing; the north declinations are increasing.

NOTE.—The Semidiameter for Mean Noon may be assumed the same as that for Apparent Noon.

+ prefixed to the hourly change of declination indicates that the south declinations are decreasing; the north declinations are increasing.

Diff. for 1 hour,
+ 9^s.8565.

NOTE.—Mean Time of the Semidiameter passing may be found by subtracting 0.18 from the Sideral Time.

+ prefixed to the hourly change of declination indicates that the north declinations are increasing.

NOTE.—Mean Time of the Semidiameter passing may be found by subtracting 0.18 from the Sidereal Time.

+ prefixed to the hourly change of declination indicates that the north declinations are increasing.

NOTE.—The Semidiameter for Mean Noon may be assumed the same as that for Apparent Noon.

+ prefixed to the hourly change of declination indicates that the north declinations are increasing.

Diff. for 1 hour,
+ 9^s.8565.

NOTE.—Mean Time of the Semidiameter passing may be found by subtracting 0.19 from the Sidercal Time.

+ prefixed to the hourly change of declination indicates that the north declinations are increasing;
— that they are decreasing.

NOTE.—The Semidiameter for Mean Noon may be assumed the same as that for Apparent Noon.

+ prefixed to the hourly change of declination indicates that the north declinations are increasing;
— that they are decreasing.

Diff. for 1 hour,

+ 9^s.8565.

NOTE.—Mean Time of the Semidiameter passing may be found by subtracting 0.19 from the Sidereal Time.

— prefixed to the hourly change of declination indicates that the north declinations are decreasing.

AT GREENWICH MEAN NOON.

NOTE.—Mean Time of the Semidiameter passing may be found by subtracting 0.19 from the Sidereal Time.

— prefixed to the hourly change of declination indicates that the south declinations are increasing;
+ that they are decreasing.

BESSEL'S FORMULÆ OF REDUCTION FOR THE FIXED STARS,

WITH DR. PETERS'S COEFFICIENTS, AND BESSEL'S NOTATION.

$$A = \tau - 0.34246 \sin \Omega + 0.00410 \sin 2 \Omega - 0.02519 \sin 2 \odot + 0.00293 \sin (\odot + 82^\circ 11')$$

$$B = -9''.2238 \cos \Omega + 0''.0895 \cos 2 \Omega - 0''.5506 \cos 2 \odot - 0''.0092 \cos (\odot + 280^\circ 53')$$

$$C = -20''.4451 \cos \omega \cos \odot$$

$$D = -20''.4451 \sin \odot$$

$$E = -0''.0462 \sin \Omega + 0''.0014 \sin 2 \Omega - 0''.0033 \sin 2 \odot$$

$$a = 3''.07236 + 1''.33691 \sin \alpha \tan \delta$$

$$b = \frac{1}{15} \cos \alpha \tan \delta$$

$$c = \frac{1}{15} \cos \alpha \sec \delta$$

$$d = \frac{1}{15} \sin \alpha \sec \delta$$

$$a' = 20''.0537 \cos \alpha$$

$$b' = -\sin \alpha$$

$$c' = \tan \omega \cos \delta - \sin \alpha \sin \delta$$

$$d' = \cos \alpha \sin \delta$$

μ = the annual proper motion in right ascension.

μ' = the annual proper motion in declination.

τ = the time reckoned from Jan. 0^d.500, (when the sun's mean longitude is 280°),
expressed in fractional parts of a tropical year.

\odot = the sun's true longitude.

Ω = the longitude of the moon's ascending node.

ω = the obliquity of the ecliptic.

α = the star's mean right ascension for the beginning of the year.

δ = the star's mean declination for the beginning of the year.

α' = the star's apparent right ascension at the time τ

δ' = the star's apparent declination at the time τ

$$\alpha' - \alpha = A a + B b + C c + D d + E + \tau \mu \quad (\text{in time})$$

$$\delta' - \delta = A a' + B b' + C c' + D d' + \tau \mu' \quad (\text{in arc})$$

The following formulæ may also be used by putting

$$f = 46''.0854 A + E = 3''.07236 A + \frac{1}{15} E \quad i = C \tan \omega$$

$$g \cos G = 20''.0537 A$$

$$h \sin H = C$$

$$g \sin G = B$$

$$h \cos H = D$$

$$\alpha' - \alpha = f + \tau \mu + g \sin (G + \alpha) \frac{\tan \delta}{15} + h \sin (H + \alpha) \frac{\sec \delta}{15} \quad (\text{in time})$$

$$\delta' - \delta = \tau \mu' + g \cos (G + \alpha) + h \cos (H + \alpha) \sin \delta + i \cos \delta \quad (\text{in arc})$$

A and B include also the following small terms of nutation:—

$$\begin{aligned} \Delta A = & +.00025 \sin (2 \odot - \Omega) + .00009 \sin (2 \Gamma' - \Omega) & \Delta B = & +0''.0067 \cos (2 \odot - \Omega) \\ & +.00010 \sin 2 (\odot - \Gamma') + .00005 \cos \Gamma' & & -0.0027 \cos (3 \odot - \Gamma) \\ & - .00005 \sin 2 (\odot - \Omega) + .00004 \sin 2 \Gamma' & & +0.0024 \cos (2 \Gamma' - \Omega) \\ & - .00011 \sin (3 \odot - \Gamma) & & -0.0023 \sin \Gamma' \\ & & & +0.0008 \sin 2 \Gamma' \end{aligned}$$

MOON'S EQUATOR.

The moon's libration in latitude and longitude, at any time, may be found by means of the following formulæ and tables:

I = the inclination to the ecliptic of the moon's equator = $1^{\circ} 28'.8$,

Ω = mean longitude of the moon's ascending node, (see page 248),

= mean longitude of the descending node of the moon's equator,

C = the angle at the centre of the moon's disc made by a meridian of the moon with the circle of declination, reckoned from north to east on the apparent disc.

i , Δ , Ω' , and ζ are defined on the next page, where their values for the year are given.

λ , β , a' , and δ' the apparent longitude, latitude, right ascension, and declination of the moon affected with parallax.

λ' = the selenocentric longitude of the earth, reckoned on the moon's equator from its descending node, Ω .

$$\left. \begin{aligned} \Delta \lambda &= -0'.57 \sin 2(\Omega - \lambda) \\ a &= \sin I \cos(\Omega - \lambda) \\ \tan B &= \tan I \sin(\Omega - \lambda) \\ \lambda' &= \lambda + \Delta \lambda + a b \end{aligned} \right\} \text{See table, page 345.}$$

The libration in latitude = $b = B - \beta$,

" " longitude = $l = \lambda' - \zeta$.

$$\sin C = \sin i \frac{\cos(\lambda' + \Delta - \Omega)}{\cos \delta'} = -\sin i \frac{\cos(\lambda' - \Omega')}{\cos b}.$$

ECLIPSES IN 1881.

In the year 1881 there will be four Eclipses, two of the Sun and two of the Moon, and a Transit of the planet Mercury over the disc of the Sun.

I. A Partial Eclipse of the Sun, May 27, 1881, invisible at Washington.

Eclipse begins on the Earth May 27^d 4^h 37^m.1, Washington mean time, in longitude 178° 40'.3 West from Washington, and in latitude 39° 9'.5 North.

Greatest Eclipse 6^h 40^m.3, in longitude 90° 24'.1 East from Washington, and in latitude 69° 3'.9 North.

Eclipse ends on the Earth 8^h 43^m.5, in longitude 17° 18'.0 West from Washington, and in latitude 46° 20'.7 North.

Magnitude of Greatest Eclipse = 0.737, (Sun's diameter = 1).

II. A Total Eclipse of the Moon, June 11, 1881, visible at Washington.

Moon enters Penumbra, June	^d ^h ^m 11 11 6.7	Washington mean time.
Moon enters Shadow,	11 12 2.5	" "
Total Eclipse begins,	11 13 4.8	" "
Middle of Eclipse,	11 13 45.7	" "
Total Eclipse ends,	11 14 26.6	" "
Moon leaves Shadow,	11 15 28.4	" "
Moon leaves Penumbra,	11 16 23.9	" "

First contact of Shadow with Moon's limb 105° from the north point towards the East, when the Moon is in the zenith, in longitude $1^{\circ} 50'$ West from Washington, and in latitude $22^{\circ} 54'$ South.

Last contact of Shadow with Moon's limb 109° from the north point towards the West, when the Moon is in the zenith, in longitude $51^{\circ} 8'$ West from Washington, and in latitude $22^{\circ} 50'$ South.

Magnitude of the Eclipse = 1.365, (Moon's diameter = 1).

III. An Annular Eclipse of the Sun, November 20-21, 1881, invisible at Washington.

Eclipse begins on the Earth November 20^d 21^h 4^m.7, Washington mean time, in longitude $60^{\circ} 12'.6$ West from Washington, and in latitude $26^{\circ} 41'.7$ South.

Central Eclipse begins on the Earth 22^h 34^m.1, in longitude $99^{\circ} 45'.9$ West from Washington, and in latitude $51^{\circ} 55'.5$ South.

Central Eclipse at Noon 23^h 34^m.0, in longitude $3^{\circ} 2'.3$ East from Washington, and in latitude $84^{\circ} 35'.8$ South.

Central Eclipse ends on the Earth November 21^d 0^h 10^m.8, in longitude $127^{\circ} 49'.8$ East from Washington, and in latitude $62^{\circ} 15'.1$ South.

Eclipse ends on the Earth 1^h 40^m.2, in longitude $78^{\circ} 44'.5$ East from Washington, and in latitude $39^{\circ} 1'.7$ South.

IV. A Partial Eclipse of the Moon, December 4-5, 1881, invisible at Washington.

Moon enters Penumbra, December ^d 4 ^h 21 ^m 8.4 Washington mean time.

Moon enters Shadow, ^d 4 ^h 22 ^m 19.5 " "

Middle of Eclipse, ^d 5 ^h 0 ^m 0.2 " "

Moon leaves Shadow, ^d 5 ^h 1 ^m 40.8 " "

Moon leaves Penumbra, ^d 5 ^h 2 ^m 52.3 " "

First contact of Shadow with the Moon's limb 61° from the north point towards the East, when the Moon is in the zenith, in longitude $158^\circ 2'$ West from Washington, and in latitude $22^\circ 0'$ North.

Last contact of Shadow with the Moon's limb 63° from the north point towards the West, when the Moon is in the zenith, in longitude $153^\circ 28'$ East from Washington, and in latitude $22^\circ 3'$ North.

Magnitude of the Eclipse = 0.979, (Moon's diameter = 1).

V. A Transit of Mercury over the Sun's disc, November 7, 1881, invisible at Washington.

The following are the times of phases at the centre of the Earth:

Ingress, Exterior Contact, November ^d 7 ^h 5 ^m 7 ^s 54 Washington mean time.

Ingress, Interior Contact, ^d 7 ^h 5 ^m 9 ^s 37 " "

Least Dist. of Centres $231''.1$, ^d 7 ^h 7 ^m 48 ^s 20 " "

Egress, Interior Contact, ^d 7 ^h 10 ^m 27 ^s 2 " "

Egress, Exterior Contact, ^d 7 ^h 10 ^m 28 ^s 46 " "

First contact of Mercury with Sun's limb 129° from the north point towards the East, when the planet is in the zenith, in longitude $80^\circ 47'.3$ West from Washington, and in latitude $16^\circ 42'.9$ South.

Last contact of Mercury with Sun's limb 78° from the north point towards the West, when the planet is in the zenith, in longitude $161^\circ 29'.9$ West from Washington, and in latitude $16^\circ 33'.3$ South.

The Washington mean time of exterior contact at Ingress and Egress for any point on the surface of the Earth may be computed from the following formulæ, in which ρ is the radius of the Earth at the place, φ' the geocentric latitude, and λ the longitude West from Washington:—

Ingress ^h 5 ^m 7 ^s 53.8 + $26.01 \rho \sin \varphi' - 34.78 \rho \cos \varphi' \cos (\lambda + 22^\circ 58')$.

Egress ^h 10 ^m 28 ^s 46.2 + $8.44 \rho \sin \varphi' + 42.43 \rho \cos \varphi' \cos (\lambda + 111^\circ 16')$.

Weisse, WEISSER's First Catalogue.

* Whole occultation below the horizon of Washington.

† Immersion below the horizon of Washington.

‡ Emersion below the horizon of Washington.

The angles of position are counted from the north point of the moon's limb, or from the vertex, towards the east, in a direction opposite to that in which the hands of a watch move.

In the following Tables x and y are the rectangular coördinates for each Satellite, referred to the centre of the primary and the major and minor axes of the apparent ellipse described by the Satellite. x is positive on the *east* side of the planet; negative on the *west* side. y is positive when *north*; negative when *south*.

x' and y' are the coördinates which correspond to a constant value of the major axis and maximum value of the minor axis, as seen from the sun at its mean distance.

The factors by which x' and y' must be multiplied to obtain the coördinates x and y at any time, are given for each Satellite on pages 476 and 477.

p is the inclination of the minor axis of the apparent ellipse to the circle of declination; reckoned from the *north*, + towards the *east*.

COORDINATES IN THE MEAN APPARENT ELLIPSE DESCRIBED BY THE
SATELLITE, AND FOR THE MEAN DISTANCE OF JUPITER
FROM THE SUN, FOR THE TIME t AFTER GEO-
CENTRIC SUPERIOR CONJUNCTION.

ON THE ARRANGEMENT AND USE OF THE TABLES IN THIS EPHEMERIS.

THE NAUTICAL PART.

THIS Part of the AMERICAN EPHEMERIS AND NAUTICAL ALMANAC is designed for the special use of NAVIGATORS and therefore adapted to the Meridian of Greenwich. It contains the Ephemeris of the sun and moon; the distances of the moon from the centres of the sun and the four most conspicuous planets, and from certain fixed stars; the Ephemerides of the planets Venus, Mars, Jupiter, and Saturn; and the Mean Places of 206 principal fixed stars for the beginning of the year 1881.

Time.—Astronomers make use of several different kinds of time; an explanation of the nature of which, and of the method of passing from one to another, properly precedes an explanation of the uses of the Ephemeris.

Solar Time.—Solar time is that used for all the purposes of ordinary life, and is measured by the daily motion of the sun. A *Solar Day* is the interval of time between two successive transits of the sun over the same meridian; and the hour angle of the sun is called *Solar Time*. This is the most natural and direct measure of time. But the intervals between the successive returns of the sun to the meridian are not exactly equal, owing to the varying motion of the earth round the sun, and to the obliquity of the ecliptic. The intervals between the sun's transits over the meridian being unequal, it is impossible to regulate a clock or chronometer so that it shall follow the sun.

To avoid the irregularity which would arise from using the true sun as the measure of time, a fictitious sun, called a *Mean Sun*, is supposed to move in the equator with a uniform velocity. This mean sun is supposed to keep, on the average, as near the real sun as is consistent with perfect uniformity of motion; it is sometimes in advance of it, and sometimes behind it, the greatest deviation being about 16 minutes.

Mean Time, which is perfectly equable in its increase, is measured by the motions of this *Mean Sun*. The clocks in ordinary use, and chronometers used by Navigators, are regulated to *mean* time.

True or Apparent Time is measured by the motion of the real sun.

The difference between the *apparent* and *mean* time is called the *Equation of Time*. By means of it we change *apparent* to *mean* time, or the reverse. Thus, if the *apparent* time be given, the *mean* time corresponding to it will be obtained by adding or subtracting the equation of time, according to the precept at the head of the column in which it is found, on page I. of the Calendar. If the *mean* time be given, the *apparent* time is obtained by applying the equation of time as directed by the precept on page II. of the Calendar.

Sidereal Time.—Sidereal time is measured by the daily motion of the stars, or, as it is used by astronomers, by the daily motion of that point in the equator from which the true right ascensions of the stars are counted. This point is the vernal equinox, and its hour angle is called the *Sidereal Time*. Astronomical clocks, regulated to sidereal time, are called sidereal clocks.

A *Sidereal Day* is the interval of time between the transit of the vernal equinox over any meridian, and its next succeeding return to the same meridian. It is about $3^m 56^s$ shorter than the mean solar day; $365\frac{1}{4}$ solar days, or a year, being divided into $366\frac{1}{4}$ sidereal days. It is divided into 24 hours. The sidereal hours are counted from 0 to 24, commencing with the instant of the passage of the true vernal equinox over the upper meridian, and ending with its return to the same meridian. About March 21 of each year the sidereal clock agrees with the mean time or ordinary clock, and it gains on it about $3^m 56^s$ per day, so that at the end of a year it will have gained an entire day, and will again agree with it.

The vernal equinox is not a fixed, but a movable, point on the equator. Its motion is composed of two parts: precession, which is proportional to the time and is combined with the daily motion of the heavens; and nutation, which is periodical. In consequence of the latter, the daily motion of the equinox is not strictly a uniform measure of time, and the sidereal time in common use might therefore be called *Apparent Sidereal Time*; and *Mean Sidereal Time* would be that reckoned from the transit of the mean equinox; but the irregularity referred to cannot exceed $2^s.3$ in a period of nineteen years, and is, therefore, of no practical importance.

Day.—The *civil day*, according to the customs of society, commences at midnight, and comprises twenty-four hours from one midnight to the next following. The hours are counted from 0 to 12 from midnight to noon, after which they are again reckoned from 0 to 12 from noon to midnight. Thus the day is divided into two periods of 12 hours each; the first of which is marked A. M., the last is marked P. M.

The *astronomical day* commences at noon of the civil day of the same date. It also comprises twenty-four hours, but they are reckoned from 0 to 24, and from the noon of one day to that of the next following. The astronomical as well as the civil time may be either *apparent* or *mean*, according as it is reckoned from *apparent* noon or from *mean* noon.

The civil day begins twelve hours before the astronomical day; therefore the first part of the *civil day* answers to the last part of the preceding *astronomical day*, and the last part of the *civil day* to the first part of the same *astronomical day*. Thus, January 9th, 2 o'clock A. M., *civil time*, is January 8th, 14^h , *astronomical time*; and January 9th, 2 o'clock P. M., *civil time*, is also January 9th, 2^h , *astronomical time*. The rule, then, for the transformation of civil time into astronomical time is this: If the civil time is marked A. M., take one from the day and add twelve to the hours, and the result is the astronomical time wanted; if the civil time is marked P. M., take away the designation P. M., and the astronomical time is had without further change.

To change astronomical to civil time, we simply write P. M. after it, if it is less than 12 hours. If greater than 12 hours, we subtract 12 hours from it, add one to the days, and write A. M. For example, January 3, 23 hours astronomical time is January 4, 11 o'clock A. M. civil time.

If the longitude from Greenwich be expressed in time, and, when *west*, *added* to the local time, or, when *east*, *subtracted* from the local time, the result is the corresponding Greenwich time. If the local mean time is used, the result is the *Greenwich mean time*, which ordinarily is that required for the use of this Part of the Ephemeris. The rule is the same, whether we use mean or sidereal time.

THE CALENDAR.—The Calendar is divided into twelve months, and to each month are assigned eighteen pages, of which the contents are as follows:

Page I. contains the *Apparent Right Ascension and Declination* of the Sun and the *Equation of Time* for each Greenwich *apparent* noon. Adjoining columns contain the

differences of these quantities for one hour. By multiplying this difference by the hours and parts of an hour from Greenwich apparent noon, and adding the amount to, or subtracting it from, the quantity at noon, according as that quantity is increasing or decreasing, we obtain the value of the quantity for any given *Greenwich apparent time*. The hourly differences are given for the instant of apparent noon at Greenwich, and, when great accuracy is required, should be first interpolated for *half* the hours and parts of an hour of the Greenwich apparent time.

This page is chiefly used when the sun is observed on the meridian, and the local apparent time is 0. The longitude from Greenwich expressed in time, if *west*, is at that instant the Greenwich apparent time, or time *after* Greenwich apparent noon; if *east*, it is time *before* Greenwich apparent noon. The longitude of any place is therefore employed in reducing the quantities on this page to apparent noon at that place.

The Right Ascension of the sun thus reduced is the *Sidereal Time of local apparent noon*. The difference between it and the clock time of the meridian passage of the sun is the error of the clock on *sidereal* time.

The Declination of the sun reduced to the meridian, or apparent noon, of the place, is required in finding the latitude from a meridian altitude of the sun.

As an example of the use of this page, let the sun's declination be required at noon of May 20th, 1881, in longitude $146^{\circ} 4' E.$, or $- 9^h 44^m 16^s$. We find

Local Apparent Time,	May 20,	^h	^m	^s
Longitude from Greenwich, (subtractive),	9	44	16
Greenwich Apparent Time,	May 19,	14	15	44

Reducing the minutes and seconds to decimals of an hour, we find that this moment is $14^h.262$ after Greenwich apparent noon on May 19, or $9^h.738$ before Greenwich apparent noon on May 20.

On page 74 of the Ephemeris we find that the change of declination in one hour is

May 19, at noon,	31".81
May 20, at noon,	30.96
Difference for one day,	0.85

If we want to be very exact, we find the amount of this hourly difference for the time which is half way between Greenwich noon and the time of observation, that is, for 7^h after Greenwich noon of the 19th, this being half of 14 hours. Seven hours is about 0.3 of a day, so the calculation is,

Difference for one hour, May 19,	31".81
Change for one day (or $0''.85$) $\times 0.3$,25
Difference at 7 hours after noon,	31.56
$31''.56 \times 14^h.262 = 450''.1 = 7' 30''.1$	

Declination at Greenwich Noon, May 19,	$19^{\circ} 51' 31''.0$ N.
Change in 14.262 hours, (additive),	7 30.1
Declination at time of observation,	$19^{\circ} 59' 1.1$

When the time of observation is only a few hours before Greenwich noon, it may be better to count the longitude backward from this nearest noon. Thus, in the example just given, the time is $9^h.738$ before Greenwich noon of May 20; the middle of the interval between the time of observation and this noon is about two-tenths of a day before noon, and the hourly motion for this time is $31''.13$. Then, we find

Sun's declination at noon of May 20,	$20^{\circ} 4' 4''.5$ N.
Product of $31''.13 \times 9^h.738 = 303''.1 =$	5 3.1
Sun's declination for observation,	$19^{\circ} 59' 1.4$

It will always be well to make the calculation by both methods, as their agreement will show both to be right.

At sea it is ordinarily sufficient to have the declination to the nearest half minute; and the reduction may be found by Table V. of BOWDITCH'S *American Practical Navigator*.

The *Equation of Time*, as has been before explained, is the number of minutes and seconds to be added to or subtracted from the *apparent* time, or the time given by an observation of the sun, to obtain the *mean* time. The heading of the column directs the manner in which the equation is to be applied. Where there is a change in the course of the month from addition to subtraction, or the reverse, as in the months of April and June, the two different directions are separated by a line, while a corresponding line below points out the date at which the change takes place. The equation of time, as given on page I., is the *mean* time of *apparent* noon, or the hour angle of the mean sun at that instant.

On page I. are also given the *Sun's Semidiameter*, which is used in reducing the altitude of a limb of the sun, or the angular distance of the limb from the moon or some other object, to the altitude, or distance, of the centre of the sun; and the *Sidereal Time of the Semidiameter passing the Meridian*, which is employed in obtaining the passage of the sun's centre over the wires of a transit-instrument, when the passage of one limb only has been observed. The quantity found in this column is to be added to the time of transit of the *first*, or western, limb, to be subtracted from the time of transit of the *second*, or eastern, limb.

Page II. contains for each Greenwich *mean* noon the *Apparent Right Ascension* and *Declination of the Sun*, the *Equation of Time*, and the *Sidereal Time of Mean Noon*. The hourly changes of these quantities are also given for noon, and may be used in reducing them to any given Greenwich *mean* time. The hourly changes may be first interpolated for *half* the Greenwich time, when great precision is required, in the way described in explaining the calculation of the declination.

The Right Ascension and Declination on pages I. and II. are affected by *Aberration*, and therefore denote the *apparent* position of the *true* sun. Page II. is more conveniently used when the *mean* time is known. This is the case in most observations of the sun out of the meridian, when the times have been noted by a clock or chronometer regulated to *mean* time. The quantities on this page can be reduced to mean noon of any place by interpolating for the longitude, as in the example of the sun's declination on the preceding page.

The sun's declination is required for finding the latitude of the place, the local time, and the sun's azimuth and amplitude, from observations of the sun.

The equation of time is needed in finding the mean time from observations of the sun, and the latitude from other than meridian observations. The heading of the column directs the manner in which it is to be applied to *mean* time to obtain the *apparent* time.

As given on page II., the equation of time is the apparent time of mean noon; and in general it is the hour angle of the *true* sun at the instant of *mean* noon.

The *Sidereal Time of Mean Noon* is also the *Right Ascension of the Mean Sun at noon*. It may be reduced for the longitude, or to any Greenwich *mean* time, by using the hourly difference, $9^s.8565$; or by Table III., in the Appendix of the *American Ephemeris*, for *reducing intervals of mean solar to sidereal time*. Table LI. of BOWDITCH'S *Navigator* may be used for the same purpose when the nearest quarter of a second only is required.

The sun's right ascension and the sidereal time of mean noon, or right ascension of the mean sun, are useful in converting solar time to sidereal time. If we add the right ascension of the *true* sun to the *apparent* time, or the right ascension of the *mean* sun to the *mean* time, the result will be the *sidereal* time.

The sidereal time of mean noon reduced for the longitude of the place, is also used in converting sidereal time to mean time. Subtracting the reduced value from the given sidereal time, gives the interval of sidereal time from noon. Subtracting from this the corresponding reduction of a *sidereal interval to a mean time interval*, in Table II. of the

American Ephemeris or Table LII. of BOWDITCH'S *Navigator*, will give the mean time required. This reduction may also be found by multiplying $9^s.8296$ by the hours and parts of an hour of the given *sidereal* time.

As examples of the use of page II.:

1. Let the sun's right ascension and the equation of time be required for 1881, June 4, 6^h 12^m 13^s A. M. mean time at a place whose longitude is $118^{\circ} 14' E.$

The local astronomical mean time is	June 3,	$18^h 12^m 13^s$
The longitude in time,	—	$7^h 52^m 56^s$
The Greenwich mean time,	June 3,	$10^h 19^m 17^s$
	or June 3,	10.3214

Sun's R. A.		Equation of time.	
June 3, Noon,	$4^h 46^m 13.49^s$	June 3, Noon,	$2^m 5.20^s$ Additive.
H. D. $10^h 273 \times 10.3214$	$+ 1^h 46.03$	H. D. $-0^h 416 \times 10.3214$	$- 4.29$
	$4^h 47^m 59.52^s$		$2^m 0.91^s$

In this case the hourly differences interpolated to 5^h.3 have been used.

The equation of time in this example is *additive* to mean time. Its reduction could have been found by Table VI., A., of BOWDITCH'S *Navigator* to seconds only.

2. If the sidereal time is required for the same date and time, we have

June 3, Noon, the R. A. of the mean sun,	$4^h 48^m 18.69^s$
Add the H. D. $9^s.8565 \times 10.3214$, or	$+ 1^h 41.73$
Add the local astronomical mean time,	$18^h 12^m 13.00^s$
The required sidereal time is,	$23^h 2^m 13.42^s$

The reduction $1^m 41^s.73$ could have been found in Table III. corresponding to the Greenwich mean time, $10^h 19^m 17^s$. By Table LI. of BOWDITCH'S *Navigator*, the reduction is $1^m 41^s.7$.

3. 1881, June 4, A. M., at a place whose longitude is $118^{\circ} 14' E.$, suppose the sidereal time to be $23^h 3^m 10^s.72$, and that the corresponding mean time is required.

The astronomical day is June 3; the longitude in time $-7^h 52^m 56^s$, or $-7^h.882$.

June 3, the sidereal time of Greenwich mean noon is	$4^h 48^m 18.69^s$
The H. D. $9^s.8565 \times (-7.882)$, or the red. for $7^h 52^m 56^s$ in Table III.	$- 1^h 17.69$
The sidereal time of local noon,	$4^h 47^m 1.00^s$
The given sidereal time ($+24^h$, if necessary for the following subtraction)	$23^h 3^m 10.72^s$
Subtracting the first from the second gives the <i>sidereal interval</i> from noon	$18^h 16^m 9.72^s = 18^h.269$
$-9^s.8296 \times 18.269$ or the reduction for $18^h 16^m 9^s$ *	$- 2^m 59.58^s$
The required astronomical mean time is,	June 3, $18^h 13^m 10.14^s$

Page III. contains the *Longitude* and *Latitude of the Sun*, and the *Logarithm of its Distance from the Earth*, at Greenwich mean noon of each day. The longitude is given in two columns, headed λ and λ' ; λ representing the sun's longitude counted from the true equinox of the date; and λ' the same coördinate counted from the mean equinox of the beginning of the year, (Jan. 0.0). A column of hourly differences enables the computer to obtain the sun's longitude for any hour from noon. The hourly differences of the logarithm of the radius vector are likewise given. The longitudes of the sun are the true longitudes, not affected by aberration. The latitude is referred to the ecliptic of the date.

The last column on page III. contains the *Mean Time of Sidereal 0^h*, that is, the number of hours, minutes and seconds after Greenwich mean noon, when the first point of Aries passes the meridian of Greenwich. It may be reduced to any meridian by interpolating for the longitude, or to any Greenwich *sidereal* time by means of the hourly difference, $-9^s.8296$. The reduction, however, can be taken directly from Table II.

* Given in Table II. of the Appendix.

of the American Ephemeris for *reducing intervals of sidereal time to mean solar time*, or approximately, from Table LII. of BOWDITCH'S *Navigator*.

This column may be used in converting sidereal time to mean time instead of that on page II. As an illustration, let us take Example 3, above.

It is seen in advance that the sum of the mean time of sidereal 0^h and the given sidereal time is greater than 24^h. Therefore the mean time of sidereal 0^h is taken out for June 2, that is the *preceding* astronomical day.

June 2 the mean time of Greenwich sidereal 0 ^h is	June 2,	19 12 28.53
The H. D. — $9^{\circ}.8296 \times (-7.882)$, or the red. for long., Table II.,	+	1 17.48
The mean time of local sidereal 0 ^h ,	June 2,	19 13 46.01
Add the given sidereal time,		23 3 10.72 = 23 ^h .053
The sum (rejecting 24 ^h) is	June 3,	18 16 56.73
— $9^{\circ}.8296 \times 23.053$, or the red. for $23^{\text{h}} 3^{\text{m}} 11^{\text{s}}$ in Table II.,	—	3 46.60
The required astronomical mean time,	June 3,	18 13 10.13

Page IV. contains the *Moon's Semidiameter* and *Equatorial Horizontal Parallax* for each mean noon and midnight at Greenwich. Columns adjoining those of the horizontal parallax give the change of this quantity in one hour, by means of which it can be reduced to any other Greenwich mean time in the same way as the sun's declination and the equation of time in the preceding examples. The sign *plus* or *minus* (+ or —) prefixed to the hourly differences, shows whether the horizontal parallax is increasing or decreasing.

The reduction of the moon's semidiameter may be readily found by multiplying the reduction of the horizontal parallax by 0.273. It may also be obtained from Table XI. of BOWDITCH'S *Navigator*, or by simply computing the proportional part.

If, for example, the semidiameter of the moon is to be taken out for 1881, June 20, 9^h P. M., Greenwich mean time, we see that the difference of the semidiameters at noon and midnight of June 20 is 5".4; then

$$\text{as } 12^{\text{h}} : 9^{\text{h}} = 5''.4 : 4''.0$$

which is the correction to be *subtracted* from the semidiameter at noon, because the semidiameter is *diminishing*. The moon's semidiameter then, for June 20, 9^h, is, $15' 35''.2 - 4''.0$, or $15' 31''.2$.

The moon's semidiameter and horizontal parallax are required for all observations of the moon. When great precision is needed, the hourly differences should be first interpolated for *half* the interval of Greenwich time from noon or midnight, and a correction applied to the horizontal parallax for the latitude of the place of observation.

The *Mean Time of the Moon's Meridian Passage* at Greenwich, which is given on page IV. to minutes and tenths of minutes, is also accompanied with a column of differences for one hour of longitude, by means of which, having the longitude turned into time, the time of the moon's meridian passage at any other place may be computed. The reduction may be taken from BOWDITCH'S Table XXVIII. by simple inspection. The last column of this page contains the *Age of the Moon*, or the time elapsed since the preceding new moon, to tenths of a day.

Pages V. to XII., inclusive, contain the *Moon's Right Ascension* and *Declination* for each day and hour of Greenwich mean time. They are accompanied with columns of *differences for one minute*, which are also given at each hour. The right ascension and declination of the moon change so rapidly, that, if they were not given at frequent intervals, the moon would cease to be useful to the practical navigator as a means of determining the latitude and time. The Greenwich mean time, which is required for taking out these quantities, may be taken from a well-regulated chronometer, or obtained by applying the longitude, turned into time, to the local mean time of the observer. The right ascension, or declination, is taken out for the day and hour of the Greenwich mean time; the *diff. for 1^m* multiplied by the *minutes* and parts of a minute of the Greenwich time; and the product added to, or subtracted from, the quantity, according as the quantity is increasing or decreasing.

Thus, suppose the moon's right ascension and declination are required for 1861, June 7, 2^h 15^m 20^s, astronomical mean time at Greenwich :

	Right Ascension.	Declination.
June 7, 2 ^h	12 ^h 49 ^m 28.72 ^s	10° 25' 14.4" S.
Diff. 2.0686 × 15.333	= + 31.72	— 11".434 × 15.333 = 2 55.3 S.
June 7, 2 ^h 15 ^m 20 ^s	12 50 04.4	10 28 9.7 S.

The differences interpolated for 7^m.67 = 0^h.13 are for the right ascension 2.0693, and for the declination 11".429, which may be used for greater precision.

Page XII. contains also the *Phases of the Moon* and the dates of the *Moon's Perigee and Apogee*, or least and greatest distances from the earth.

Pages XIII. to XVIII., inclusive, contain the *Lunar Distances*, or the angular distances of the centre of the moon from the centre of the sun, the four larger planets, and certain fixed stars, as they would appear to an observer at the centre of the earth. They are given for every third hour of Greenwich mean time, beginning at noon; the dates are therefore *astronomical*. All the distances that can be observed on the same day are grouped together under that date; and the columns are read from left to right, across both pages of the same opening. The letter W., or E., is affixed to the name of the sun, planet, or star, to indicate that it is on the west, or east, side of the moon.

An observer on the earth's surface having measured a *Lunar Distance*, corrected it for errors of his instrument and for the semidiameter of the objects, and cleared it from the effects of refraction and parallax, finds the *true*, or *geocentric*, distance, that is, the distance as it would have appeared from the centre of the earth at the moment of observation. With this distance and the distances in the Ephemeris of the same bodies on the same day, the *Greenwich mean time* of the observation can be found.

To lessen the labor of computation, there is given in the Ephemeris, between every two successive distances, the *logarithm of the seconds of time in which the distance changes 1"*; or, as it is usually called, the *proportional logarithm of the difference*. It is given for the *middle instant* of the two hours between which it is placed.

For computing the *Greenwich time* we have the following rule:

Find in the Almanac the two distances between which the true distance falls; take out the nearest of these, the hours of Greenwich time over it, and the *P. L. of Diff.* between them.

Find the difference between the true distance and the distance taken from the Almanac; and from the *proportional logarithm* of this difference, as found in the Navigator, subtract the *P. L. of Diff.* taken from the Almanac.

The result is the *proportional logarithm* of an interval of time to be *added* to the hours of Greenwich time, taken from the Almanac, when the *earlier* Almanac distance is used; to be *subtracted* from the hours of Greenwich time, when the *later* Almanac distance is used.

Another method is, to *add* the *common logarithm* of the difference of the true and the Almanac distances to the *P. L. of Diff.* of the Almanac; the sum will be the *common logarithm* of the correction to be applied to the hours of Greenwich time. The Table of *Logarithms of small Arcs in Space or Time*, given at the end of the volume for 1871, saves the operation of reducing degrees (or hours) and minutes to seconds, and the reverse.

As the *P. L. of Diff.* in the Ephemeris varies, the Greenwich time, found by the methods just described, may not be sufficiently exact. To correct it for such variation, or *2d difference*, take the difference between the *P. L. of Diff.* used and the one which follows it in the Ephemeris, (or, more strictly, half the difference of the preceding and following ones.) With this difference, and the first correction of the Greenwich time already found, enter Table I. Appendix, and take out the corresponding seconds, which are to be *added* to the approximate Greenwich time if the *Prop. Logs.* in the Ephemeris are *decreasing*; to be *subtracted* if they are *increasing*.

Thus the *Greenwich mean time* of the observation can be obtained. If the observer has noted the time of observation by a chronometer, the difference of this chronometer time and the Greenwich mean time will be the *error* of the chronometer or Greenwich time as found from the Lunar Distance. The agreement or disagreement of this error with that brought up from the error and rate of a previous date, may show whether the chronometer has run well or ill. In this way Lunar Distances can be used as a check upon the chronometer. By a series of carefully observed Lunar Distances on both sides of the moon, the chronometer error can be tolerably well ascertained.

If the observer has found the *local mean time* of observation from the observed altitude of one of the bodies, or by a watch regulated to that time by recent observations and corrected for change of longitude in the interval, the difference of this local time and the Greenwich time found from the Lunar Distance will be his longitude.

As an example of finding the Greenwich mean time from a Lunar Distance, suppose that in 1881, June 10, about 17^h of Greenwich mean time, the corrected distance of the moon's centre from α Aquilæ is 60° 35' 42'' :

Corrected distance,		60° 35' 42''	
Distance in the Ephemeris, June 10,	15 ^h 0 ^m 0 ^s	61 22 4	P. L. 2786
Difference,		46 22	P. L. 5891
Time from 15 ^h (after)	+ 1 28 4		P. L. 3105
Corr. for 2d Diff., Table I,	— 3		
Greenwich Mean Time, June 10,	16 28 1		

By a Table of common logarithms, or a Table of logarithms of small arcs, the reduction of the Greenwich time would be found thus :

From Ephemeris,		P. L. 0.2786
Diff. of distances,	46' 22'' = 2782''	log 3.4444
Red. of Greenwich time,	+ 1 ^h 28 ^m 4 ^s = 5284 ^s	log 3.7230

the result being the same as by the previous method.

Pages 218 to 241, inclusive, contain the ephemerides of the four principal planets, Venus, Mars, Jupiter, and Saturn. The ephemeris of each consists of its *Apparent Right Ascension* and *Declination* and their *Variations in one hour*, for each Greenwich mean noon; *Mean Time of its Meridian Passage*; and, at the bottom of the page, its *Semidiameter* and *Horizontal Parallax*.

North declinations are marked +, south declinations —. + prefixed to the change of declination of the sun, moon, a planet, or a star, indicates that north declinations are increasing, or south declinations are decreasing; — indicates that north declinations are decreasing, south declinations increasing.

The right ascension and declination of a planet are required in all observations of it for time, latitude, or azimuth. The mode of reducing them to any instant of Greenwich mean time is the same as in the examples of the sun previously given. The mean time of passage across any meridian can be found by dividing the *daily* difference by 24, and using the *hourly* difference thus obtained, as in the case of the moon; or, the reduction can be found by the proportion: As 24^h (or 360°) is to the longitude, so is the daily difference to the reduction required.

THE ASTRONOMICAL PART.

This part is adapted to the meridian of Washington; and Washington time, *astronomical* or *sidereal*, is required in its use. The longitude of Washington from Greenwich is assumed to be $+5^h 8^m 12^s$.

Obliquity of the Ecliptic, &c., page 248.—This page contains for every tenth day of the year the *Apparent Obliquity*, which is required for the transformation of longitudes and latitudes to right ascensions and declinations, or the reverse; the *Equation of Equinoxes* in longitude and right ascension, commonly called Nutation, or the reduction which is to be applied to a longitude counted from the *mean* equinox of the date in order to obtain the longitude from the true equinox of the date; the *Precession of Equinoxes* in longitude, or the reduction of longitudes from the mean equinox of January 1 to the mean equinox of the date; the *Sun's Aberration*, which is to be applied to the *true* longitude of the sun, as given in the Ephemeris, to obtain its *apparent* longitude; the *SUN's Equatorial Horizontal Parallax*; and the *Mean Longitude of the Moon's Ascending Node*.

At the bottom of the page are given the *Mean Obliquity* for the beginning of the year; the *Annual Precession* for the middle of the year, the precession in a sidereal and in a solar day, and the *daily motion* of the moon's node in longitude.

Fixed Stars.—Pages 249–257 contain for each mean midnight the logarithms of *A, B, C, D*, also *f, G, H, i*, and logarithms of *g, h, and i*, (following BESSEL's notation,) for reducing the *mean* places of the Fixed Stars at the beginning of the year to their *apparent* places on any day.

The formulæ by which they are prepared, and those employed in their use, are given on page 258. The coefficients are those of PETERS and STRUVE. The terms relating to right ascension are expressed in time.

The first set of quantities requires for the star the logarithms of *a, b, c, d, a', b', c', d'*, which are to be found in some Star Catalogues. The other set requires no other star constants than the right ascensions and declinations. *f, G, and H* are given in time, as well as arc, to facilitate their use with tables of sines, &c., which have the argument in time.

For a star near the pole, it is best to compute the reductions with the mean right ascension and declination at the date instead of the beginning of the year, (or the logarithms of *a, b, c, &c.*, reduced to the date), and add such of the following terms as may be of sufficient magnitude:

In Right Ascension.	In Declination.
$+ 0^s.000003 \tau^2 \sin \alpha \} \tan \delta$	$+ 0''.000975 \tau^2 \sin^2 \alpha$
$- 0^s.000149 \tau^2 \cos \alpha \} \tan \delta$	$- 0''.000023 \cos 2 \Omega \cos 2 \alpha$
$- 0^s.0000650 \tau^2 \sin 2 \alpha \} \tan^2 \delta$	$- 0''.000080 \cos 2 \Omega \cos 2 \alpha$
$+ 0^s.0000103 \sin 2 \Omega \cos 2 \alpha \} \tan^2 \delta$	$- 0''.000077 \sin 2 \Omega \sin 2 \alpha$
$- 0^s.0000107 \cos 2 \Omega \sin 2 \alpha \} \tan^2 \delta$	$+ 0''.000040 \cos 2 \Omega \cos 2 \alpha$
$+ 0^s.0000620 \sin 2 \Omega \cos 2 \alpha \} \sec^2 \delta$	$- 0''.000467 \cos 2 \Omega \cos 2 \alpha$
$- 0^s.0000622 \cos 2 \Omega \sin 2 \alpha \} \sec^2 \delta$	$- 0''.000465 \sin 2 \Omega \sin 2 \alpha$
$+ 0^s.0000513 \sin (\odot + \Omega) \cos 2 \alpha \} \tan \delta \sec \delta$	$- 0''.00004 \cos (\odot + \Omega)$
$- 0^s.0000507 \cos (\odot + \Omega) \sin 2 \alpha \} \tan \delta \sec \delta$	$- 0''.00038 \cos (\odot + \Omega) \cos 2 \alpha$
$+ 0^s.0000097 \sin (\odot - \Omega) \cos 2 \alpha \} \tan \delta \sec \delta$	$- 0''.00038 \sin (\odot + \Omega) \sin 2 \alpha$
$- 0^s.0000053 \cos (\odot - \Omega) \sin 2 \alpha \} \tan \delta \sec \delta$	$- 0''.00038 \cos (\odot - \Omega) \cos 2 \alpha$
	$- 0''.00004 \cos (\odot - \Omega) \sin 2 \alpha$
	$- 0''.00007 \sin (\odot - \Omega) \sin 2 \alpha$

Pages 259–262 contain the *mean places* and *annual variations* of 208 Fixed Stars for 1881, Jan. 0^d—500, or 1880, Dec. 30.500, the instant when the sun's mean longitude is 280°. τ on the preceding pages is reckoned from the same epoch.

The *apparent* places of α, δ , and λ Ursæ Minoris, and of 51 Cephei, are given on pages 263–274 for every upper transit at Washington. They include the terms depending on 2ζ and $\zeta - \Gamma'$, as well as other small terms given above and on page 258, so far as they were of sufficient importance.

The *apparent* places of the remaining 204 stars follow on pages 275–325, in the order of their right ascensions. They are given for every tenth transit, together with their motions in ten days; and include all terms of the preceding formulæ exceeding $0^{\circ}.003$ in right ascension, or $0^{\circ}.03$ in declination, except those which depend on 2 C and $\text{C} - \text{I}''$. The mean solar time of transit is also given to the nearest tenth of a day.

Solar Ephemeris.—Pages 326–331 contain the *Apparent Right Ascension* and *Declination* of the SUN for each mean and apparent noon at Washington; the *Hourly Motion* at mean noon; the *Equation of Time* at apparent noon with the sign of its application to apparent time; the SUN's *Semidiameter* and the *Sidereal Time of its passing the Meridian*; and the *Sidereal Time of Mean Noon*. The explanation and use of these quantities is substantially the same as in the Greenwich part of the Ephemeris.

The SUN's *Equatorial Horizontal Parallax* will be found on page 248.

Moon-Culminations.—Pages 332–334 contain the mean solar time of the *Upper Transit* of the MOON's centre at Washington, expressed to hundredths of a minute, the *difference* for one hour of longitude, and the *Sidereal Time of Semidiameter passing the Meridian*, both given for the instant of transit at Washington. The numbers in the fifth column indicate the STARS in the list of *Moon-Culminating Stars*, pages 335–338, within 30^m of the moon in right ascension. Those nearest the moon in declination are proper to be observed with the moon at each transit. The *bright Limb* of the Moon is indicated by the Roman numerals in the last column.

The time of transit at any place, within six hours of Washington in longitude, may be found with sufficient accuracy from the time of the Washington transit by using the hourly difference interpolated for a longitude from Washington equal to *half* that of the given place. With this time reduced to Greenwich time the moon's right ascension can be taken from the Lunar Ephemeris, pages V–XII of each month, as in the example on page 489. If greater precision is required, or the place is more than six hours from Washington, we may, from the right ascension thus obtained, (which is nearly the *local sidereal time*,) find the *local mean time*, as on page 487, more accurately than before, and thence the *Greenwich mean time*, and with this revise the computation.

As an example, suppose the right ascension of the bright limb of the moon to be required at the transit of January 22, 1881, at Berlin, in longitude

$$\begin{array}{l} 6^{\text{h}} \ 1^{\text{m}} \ 47.0^{\text{s}} = 6.0297 = 0.2512 \text{ East of Washington.} \\ 0 \ 53 \ 34.9 \qquad \qquad \qquad \text{East of Greenwich.} \end{array}$$

Jan. 22, 1881, Transit at Washington	Jan. 22, 17 52.63
Corr. for longitude $-6.0297 \times 2^{\text{m}}.128$	— 12.83
Transit at Berlin	Jan. 22, 17 39.79
Longitude from Greenwich	— 53.58
Greenwich mean time	16 46.21
Moon's R. A., Jan. 22, 17 0.0	13 50 57.47
Reduction for — 13.79 $-13.79 \times 2^{\text{m}}.1987$	— 30.32
Moon's R. A., Jan. 22, 16 46.21	13 50 27.15
Sidereal time of semidiameter passing	+ 1 7.84
R. A. of II, or bright limb	13 51 34.99

The difference of long., $2^{\text{m}}.128$, is found by interpolating back $0^{\text{d}}.126$ from that given on page 332; and $2^{\text{m}}.1987$, the change in R. A. in 1^{m} by interpolating back 7^{m} from that given on page 11 for Jan. 22, 17^{h} . The time of the semidiameter passing the meridian is interpolated back $0^{\text{d}}.2512$ from that given on page 332, for Jan. 22, and is added to the right ascension of the centre, as the bright limb is II, or the following one.

The Greenwich mean time computed from the right ascension of the centre at the time of transit at Berlin (or the sidereal time at Berlin) is $16^{\text{h}} \ 46^{\text{m}} \ 13^{\text{s}}.44$, and the consequent correction of that right ascension is $0^{\text{d}}.00$.

Moon-Culminating Stars, pages 335–338.—The *mean* places, with their annual variations, of 218 stars near the moon's path are given for the beginning of the fictitious year (1880, Dec. 30.500). The names of those whose *apparent* places are given in the Ephemeris of the *Fixed Stars* are printed in SMALL CAPITALS, and the reductions from *mean* to *apparent* places for those which will be occulted by the moon during the year, may be found in the pages of Occultations.

The *apparent* places of the others may be obtained by the quantities and formulæ on pages 249–258.

1881.—EXAMPLE.

Computation of the apparent place of μ Geminorum, (a star proper to be observed with the moon on January 13.)

The Washington mean time of transit at Paramatta is January 13, 19^h 32^m (6^m after that of the moon) or 0^d.31 after midnight of January 13. The quantities from page 249 or page 252 are to be taken out for this time.

FIRST METHOD.

<i>E</i>	+ .004	$\tau \mu'$.00
$\tau \mu$.000	
<i>Apparent Place,</i>	$\alpha' = 6^{\text{h}} 15^{\text{m}} 48.52$	$\delta' = +22^{\circ} 34' 20.9$

SECOND METHOD.

$\alpha = 6^{\text{h}} 15.8$		$\delta = +22^{\circ} 34.4$
$G = 0 27.0$		$G + \alpha = 6^{\text{h}} 42.8$
$H = 22 28.9$		$H + \alpha = 4 44.7$
$\log \frac{1}{r}$ 8.824	$\log \frac{1}{r}$ 8.824	
$\log g$ 0.909	$\log h$ 1.305	$\alpha = 6^{\text{h}} 15 45.690$
$\log \sin (G + \alpha)$ 9.992	$\log \sin (H + \alpha)$ 9.976	f + 1.236
$\log \tan \delta$ 9.619	$\log \sec \delta$ 0.035	(g) + .221
$\log (g)$ 9.344	$\log (h)$ 0.140	(h) + 1.380
		$\tau \mu$.000
	<i>Apparent Right Ascension . . .</i>	$\alpha' = 6 15 48.53$
$\log g$ 0.909	$\log h$ 1.305	
$\log \cos (G + \alpha)$ 9.269 π	$\log \cos (H + \alpha)$ 9.509	$\delta = +22^{\circ} 34' 23.02''$
$\log (g')$ 0.178 π	$\log \sin \delta$ 9.584	(g') - 1.51
	$\log (h')$ 0.398	(h') + 2.50
$\log i$ 0.529 π		(i) - 3.12
$\log \cos \delta$ 9.965		$\tau \mu'$.00
$\log (i)$ 0.494 π	<i>Apparent Declination . . .</i>	$\delta' = +22 34 20.9$

The Moon's *Semidiameter* and *Equatorial Horizontal Parallax* for each mean noon and midnight are on pages 339–342.* In the moon's ephemeris, as in that of the sun, the hourly motions belong to the instants for which they are given. The hourly change of semidiameter is equal to $0.2723 \times$ that of the horizontal parallax.

*For eclipses and occultations BURKHARDT's value of the semidiameter, which is 27.5 less, is preferred.

The times of the *Moon's Phases, Apogee, Perigee, and greatest Libration*, are given on page 343; the position of the *Moon's Equator* and the *Moon's mean longitude* on page 344; and a Table for computing the *Libration* of the Moon on page 345.

The *Ephemerides of the seven principal Planets* (pages 346–387) are given both for *mean noon* and the *time of transit*. The *hourly differences* are also given for the same instants.

The *Horizontal Parallaxes, Vertical Semidiameters, and Sidereal Times of the Semidiameters passing the Meridian*, are on pages 388 and 389.

The *Sun's Coördinates* (pages 390–401) are given for each mean noon and midnight, referred to the apparent equinox and equator, and also to the mean equinox and equator at the beginning of the year, (Jan. 0^d.0.) In the case of the rectangular coördinates, only the last four decimals are given for the mean equinox and equator, and the first three places are to be taken from the apparent equinox and equator. When a change of a unit is to be made in the third place, it is indicated by a corresponding colon (:). The latitude is referred to the ecliptic of the date. The reduction to the mean ecliptic of Jan. 0, is $+0''.488 \tau \sin (\odot + 187^\circ)$, in which τ is the time from Jan. 0, in parts of a year.

The *Heliocentric Coördinates* of the Planets (pages 402–408) are referred to the mean equinox and ecliptic of the mean noon of the 2405,000th day of the Julian Period, or 1872, July 25.

The columns — $\frac{k^2}{r^3}x$, &c., contain the quantities — $1600 m \frac{k^2}{r^3}x$, — $1600 m \frac{k^2}{r^3}y$, — $1600 m \frac{k^2}{r^3}z$, in units of the 7th decimal place, in which m denotes the mass of the planet, and k^2 the unit of attractive force in the solar system, or $\log k = 8.2355814$.

Page 409 contains the *Inclinations, and Longitudes of the Ascending Nodes* at the same epoch, and the *Masses* of the several Planets, with their logarithms. The changes of the Inclinations and Nodes in 100 days are also given.

The Heliocentric Coördinates and Masses of the Planets are given for the computation of perturbations.

Eclipses.—Pages 410–415 contain the elements necessary for computation, and the principal phases of each eclipse of the SUN and MOON. The semidiameters of the moon are $2''.5$, and those of the sun $2''.2$, less than those in the Ephemeris.

The charts of the *Solar Eclipses* show the part of the world in which each is visible. The dotted curves pass through places where the eclipse begins, or ends, at an exact hour of Washington mean time, and aid in finding an approximate time of the beginning, or end, at any place. The limits and central line will give some idea of the magnitude of the eclipse. The longitudes are reckoned west from Washington.

The Tables of *Data of the Solar Eclipses* contain certain quantities* derived from the elements and independent of the place of observation. They are given for each tenth minute of Washington mean time; and if their values for the *Penumbra* be taken out for a time T_0 , assumed near that of the beginning, or end, of the eclipse at any place, the prediction for that place may be computed quite accurately by the following formulæ:

$$\begin{aligned} \text{Let } \varphi &= \text{the latitude of the place, } + \text{ when north,} \\ \lambda &= \text{its longitude from Washington, } + \text{ when west,} \\ (\text{Bessel}) \log c &= 8.912205, \quad \log (1 - e^2) = 9.9970916, \quad \sin \chi = e \sin \varphi, \\ h &= \sec \chi \cos \varphi, \quad k = (1 - e^2) \sec \chi \sin \varphi, \\ a &= A - h \sin (\mu - \lambda), \\ b &= B - E k + G h \cos (\mu - \lambda), \\ c &= -C + F k - H h \cos (\mu - \lambda), \\ m &= \sqrt{b c} \quad (\text{usually with same sign as } a). \end{aligned}$$

*The formulæ are given in CHAUVENET'S *Spherical and Practical Astronomy*, Vol. I, page 513. The changes of A , B , and C for one minute, or one second, are expressed in units of the sixth decimal place.

If $m = a$, the time T_0 is correctly chosen. If m differ from a , a correction t of the assumed time may be obtained in seconds by the formulæ,

$$\log \mu' = 1.86167, \quad a' = A' - \mu' h \cos (\mu - \lambda),$$

$$\tan \frac{1}{2} Q = \frac{c}{m} = \frac{m}{b}, \quad b' = B' - \mu' G h \sin (\mu - \lambda),$$

$$t = \frac{1000000 (m - a)}{a' + b' \cot Q}$$

and a new approximation to the actual Washington time will be

$$T_0' = T_0 + t,$$

with which the computation may be revised.

Thus successive approximations are made until for the last assumed time $T_0, m = a$ very closely, and t is quite small. The local mean time of the phenomenon will be, using the last values of T_0 and t ,

$$T_0 + t - \lambda.$$

Q must be taken of the same sign with a , and is a sufficiently near approximation to the angular distance of the point of contact reckoned from the *north* point of the sun's limb, + towards the *east*.

For a total or annular eclipse, the prediction of the interior contacts may be made in the same way, using the *Data* for the *Shadow*; except that Q will have a sign opposite that of a in a total eclipse.

To find V , the angular distance of the point of contact from the *Vertex* of the sun's limb, + towards the *left*, we have the formulæ

$$p \sin P = \sin \varphi, \quad c \sin C = \cos P \tan (\mu - \lambda)$$

$$p \cos P = \cos \varphi \cos (\mu - \lambda), \quad c \cos C = \sin (P - \delta')$$

$$V = Q - C,$$

in which δ' is the sun's declination.

If the values of Q at the beginning and at the end of the eclipse be found, and their difference (with regard to signs) be denoted by 2θ , the number of digits eclipsed is

$$12(1+n) \sin^2 \frac{1}{2} \theta, \quad \text{or } 12(1+n) \cos^2 \frac{1}{2} \theta,$$

according as θ is acute or obtuse; n being the quotient of the semidiameter of the moon divided by that of the sun.

θ may also be found from the formulæ:

$$\tan R = \frac{b'}{a'}, \quad \theta = Q + R$$

(in which R has the sign of b'); and the expression of t may be changed to

$$t = 1000000 \cdot \frac{m - a}{a'} \cdot \frac{\sin Q \cos R}{\sin \theta}.$$

The following is an example of the computation of the beginning of the Eclipse of May 27, 1881, for the Observatory at Chicago, for which

$$\varphi = +41^\circ 50' 1''.0$$

$$\lambda = 10^\circ 33' 33''.9$$

$$(1) \quad \log e = 8.912205$$

$$(2) \quad 1. \sin \varphi = 9.8241061$$

$$(3) \quad \log (1 - e^2) = 9.9970916$$

$$(4) \quad 1. \sec \chi = 0.0006457$$

$$(5) \quad 1. \cos \varphi = 9.8722057$$

$$(1) + (2) \quad 1. \sin \chi = 8.736311$$

$$(2) + (3) + (4) \quad \log k = 9.8218434$$

$$(4) + (5) \quad \log h = 9.8728514$$

By the chart the Washington mean time of the beginning of the eclipse at Chicago is $7^{\text{h}} 40^{\text{m}}$, for which we take from the table for *Penumbra*, on page 410, the values of A, B, C , &c.

Computation of t , the correction of T_0 .

		$\mu = 115^\circ 45' 21.1''$ (9)	$\log E = 9.969601$

Correction of the assumed time $t = -4.3$

Washington time of beginning May 27, 7 39 55.7

Local time of beginning May 27, 6 57 41.4

We have also $C = 46^\circ 5'$, and the angle from the Vertex, $V = -76^\circ 57'$.

Occultations.—Pages 416–453 contain *Elements for facilitating the Prediction of Occultations of Planets and Stars by the Moon*. The list includes all stars to the $6\frac{1}{2}$ magnitude in the principal catalogues, and a few others of less magnitude contained in the *Almanac Catalogue of Zodiacal Stars* and chiefly belonging to clusters which can be occulted during the year.

The mean places of many of these stars for the beginning of the year are given on pages 335–338. The reductions to apparent place are given for each date of occultation.

Pages 454–456 contain a list of such occultations and near approaches as will be visible at Washington during the year 1881. For the latter, the time of nearest approach, the nearest point of the moon's limb, and the distance of the star from the moon's limb are stated.

The elements comprise the *Date, the Name, Magnitude and Declination of the Star*, the *Limiting Latitudes* within which the occultation may be visible, and at the time of geocentric conjunction of the moon and star in right ascension the following quantities:

$$\begin{aligned} \zeta &= \text{Washington mean time,} \\ H &= \text{Hour angle of the star at Washington, + when west;} \\ X &= \frac{15 (\alpha - \alpha')}{\pi} \cos \delta = 0, & Y &= \frac{\delta - \delta'}{\pi}, \\ x' &= \frac{15 \Delta \alpha}{\pi} \cos \delta, & y' &= \frac{\Delta \delta}{\pi}, \end{aligned}$$

the hourly changes of x and y ;

in which α and δ are the apparent right ascension and declination of the moon,

$\Delta \alpha$ and $\Delta \delta$, their motions in one hour of mean time,

π , the moon's equatorial horizontal parallax,

α' and δ' , the apparent right ascension and declination of the star.

The reductions of the mean place of the star at the beginning of the year to its apparent place at the date, are also given to facilitate the reduction of observed occultations.

For any other Washington mean time, $T = \zeta + t$, we have (μ being the sidereal equivalent of t , and t as a coefficient being expressed in hours)

$$h = H + \mu, \text{ the star's hour angle at Washington,}$$

$$x = t x', \quad y = Y + t y'.$$

As the moon's motion is here regarded as uniform, the expressions for x and y are more nearly correct the smaller the interval t . The exact values, to be employed in the reduction of an observed occultation, are

$$x = \frac{\sin (\alpha - \alpha') \cos \delta}{\sin \pi}$$

$$y = \frac{\sin (\delta - \delta') \cos^2 \frac{1}{2} (\alpha - \alpha') + \sin (\delta + \delta') \sin^2 \frac{1}{2} (\alpha - \alpha')}{\sin \pi}$$

in which α , δ and π are to be taken from the ephemeris for the time of observation. But for predicting the times of *immersion* and *emersion*, and the points on the moon's limb where these appearances take place, the preceding expressions suffice to enable the observer to determine when and where to watch for these phenomena.

For the place of observation, let

φ = its latitude, + when north ;

λ = its longitude from Washington, + when west ;

$$(Bessel) \quad \log e = 8.912205, \quad \log (1 - e^2) = 9.9970916,$$

$$\sin \chi = e \sin \varphi, \quad E = (1 - e^2) \sec \chi, \quad F = \sec \chi.$$

$$\mu' = 54147.8 \sin 1'', \quad \log \mu' = 9.41916.$$

The constants for the place, required both in the prediction of occultations and the reduction of those observed, are φ , λ , and $E \sin \varphi$, $F \cos \varphi$, $\mu' F \cos \varphi$, or their logarithms.

The values of E and F and their logarithms are given for different latitudes in the following table :

φ	E .	F .	Log E .	Log F .
0°	1—.0067	1.0000	9.9971	0.0000
± 10	1—.0066	1.0000	9.9971	0.0000
20	1—.0063	1.0004	9.9973	0.0002

80	1—.0034	1.0033	9.9985	0.0014
90	1—.0033	1.0034	9.9985	0.0014

An occultation will not be visible unless,

1. The latitude of the place is included within the limiting parallels ;
2. At the time of occultation, or the local mean time ($T - \lambda$), the sun is sufficiently below the horizon ;

3. At that time the star is above the horizon, or its local hour angle ($h-\lambda$) is numerically less than τ found by the formula

$$\cos \tau = -\tan \varphi \tan \delta'.$$

A table of τ , or the hour angle of a body in the horizon, computed for the latitude of the place and different declinations, will be useful for such comparisons.

These conditions can generally be determined in advance, as in latitudes less than 60° ($\delta-\lambda$) may be used instead of ($T-\lambda$) except within two hours of sunrise or sunset; and ($H-\lambda$) instead of ($h-\lambda$) except within half an hour of the star's rising or setting. For these exceptional cases, which, however, are not favorable for observation, the time of *apparent* conjunction in right ascension, or some nearer approximation to the time of occultation, can be subsequently employed.

Having ascertained that an occultation will be visible, we may proceed to compute the times of immersion and emersion by the following formulæ:

1. To find approximately the time* of *apparent* conjunction in right ascension, as affected by parallax;

$$u = F \cos \varphi \sin (H-\lambda)$$

$$u' = \mu' F \cos \varphi \cos (H-\lambda)$$

In hours,

$$(t) = \frac{u}{x' - u'}$$

Washington time of *apparent* conjunction, (T) = $\delta + (t)$

Local " " " " (T) - λ

The value of (T) to the nearest tenth of an hour is sufficiently accurate. If a closer approximation is desired, the computation may be repeated, using $h = H + (\mu)$ instead of H , (μ) being the sidereal equivalent of (t),

$$x = (t) x' \quad (t') = -\frac{x - u}{x' - u'} \quad (T') = (T) + (t').$$

2. To find a nearer approach to the time of either phase, let us assume the Washington mean time T , which for the first computation may be the computed time of *apparent* conjunction, or some conjectural time near it later, if $H-\lambda$ is west, or +, earlier if $H-\lambda$ is east, or -. For this time find

$$t = T - \delta$$

$$h = H + \mu, \text{ or } h - \lambda = H - \lambda + \mu$$

$$x = t x'$$

$$y = Y + t y',$$

and then T_1 and T_2 , the approximate Washington mean times of immersion and emersion, by the following formulæ. The local mean times will be found by subtracting from T_1 and T_2 the longitude of the place.

$$A \sin B = E \sin \varphi$$

$$u = F \cos \varphi \sin (h-\lambda)$$

$$u' = \mu' A \cos B$$

$$A \cos B = F \cos \varphi \cos (h-\lambda)^\dagger$$

$$v = A \sin (B - \delta')$$

$$v' = \mu' u \sin \delta'$$

[or, with other auxiliaries than A and B ,

$$b = F \cos \varphi \cos (h-\lambda)$$

$$u' = b \mu'$$

$$v' = E \sin \varphi \cos \delta' - b \sin \delta']$$

$$m \sin M = x - u$$

$$n \sin N = x' - u'$$

$$m \cos M = y - v$$

$$n \cos N = y' - v'$$

(Burckhardt)

$$k = 27227$$

$$\log k = 9.43500$$

$$\cos \psi = \frac{m \sin (M - N)}{k}$$

$$\psi < 180^\circ$$

* It is convenient, but not necessary, to have this time.

† If ($h-\lambda$) be restricted to values numerically less than 12° , or 180° , B may be taken in the same quadrant with ($h-\lambda$), and have the same sign as the latitude. For a place where many occultations are observed, tables of A , B , u and u' for different values of ($h-\lambda$), or of $E \sin \varphi \cos \delta'$ for different declinations, would be convenient.

	For Immersion.	For Emersion.
In hours,	$t_1 = -\frac{m \cos (M-N)}{n} - \frac{k \sin \phi}{n}$	$t_2 = -\frac{m \cos (M-N)}{n} + \frac{k \sin \phi}{n}$
Washington mean time, $T_1 = T + t_1$		$T_2 = T + t_2$
Local " " $T_1 - \lambda$		$T_2 - \lambda$

3. Assuming now $T_1 = \phi + t + t_1$ for the immersion, or $T_2 = \phi + t + t_2$ for the emersion, as the Washington time instead of T , and recomputing, we can obtain nearer approximation to the times of these phenomena. But the first operation will give the times usually within one or two minutes, which is sufficiently accurate for watching for an immersion. For an emersion a more accurate knowledge is desirable. But for this purpose it will often be sufficient to substitute $(h_2 - \lambda) = (h - \lambda + \frac{1}{2} \mu_2)$ for $(h - \lambda)$ in the computation of u' and v' , and, using the same m and M as before, recompute n , N , ϕ and t_2 , a new correction to be added to T .

If $\log. m \sin (M-N) = 9.4350$ nearly, a recalculation will generally be necessary to determine whether, numerically, $\cos \phi < 1$, or $\cos \phi > 1$. In the latter case the impossible value of $\cos \phi$ indicates that an occultation at the given place is impossible, unless the computed distance from the moon's limb is within the errors of the ephemeris of the moon and star.

In such cases of near approach to the moon's limb, we may take $\phi = 0^\circ$, or 180° , according as $m \sin (M-N)$ is $+$ or $-$; and for finding the time of nearest approach,

$$t = -\frac{m \cos (M-N)}{n}$$

The distance from the moon's limb is then

$$\pi [m \sin (M-N) - k],$$

disregarding the sign of $m \sin (M-N)$; or, allowing for the augmentation of the semi-diameter,

$$\pi [m \sin (M-N) - k] [1 + z \sin \pi],$$

where

$$z = A \cos (B - \delta').$$

4. Having found satisfactorily the times of immersion and emersion, and therefore N and ϕ in each case, we have as the angle from the *North point* of the moon's limb, positive towards the *East*,

$$\begin{aligned} Q &= N - 90^\circ + \phi && \text{for an Immersion,} \\ Q &= N - 90^\circ - \phi && \text{for an Emersion;} \end{aligned}$$

and, taking

$$\begin{aligned} c \sin C &= u + t u' \\ c \cos C &= v + t v', \end{aligned}$$

in which the last value of t for the particular phase is properly used, we have as the angle from the *Vertex* of the moon's limb, or that point which is nearest the zenith,

$$V = Q - C$$

also reckoned positive in the same direction as Q , i. e., from North toward East.

5. As a check on the accuracy of the work, we have, using the last computed values of the several quantities,

$$[(x-u) + t(x'-u')]^2 + [(y-v) + t(y'-v')]^2 = k^2 = 0.07413;$$

Or, we may compute u , v , x , and y , with the last determined time of immersion, or of emersion, and we should have for either, as the condition of the phenomenon,

$$(x-u)^2 + (y-v)^2 = k^2 = 0.07413$$

$$\text{or,} \quad \log m = \log k = 9.4350$$

1881.—*Example*.—The times of immersion and emersion, and the angles of position of the points of contact, are required for an occultation of B. A. C. 5335, January 24, 1881, at New Orleans, Louisiana, for which

$$\varphi = +29^{\circ} 57'.5$$

$$\lambda = +0^{\text{h}} 51^{\text{m}}.8$$

The data for computation are given on page 418. On looking at the data, we find that φ is included between the limiting parallels of latitude, and, subtracting λ from H , that the star must be less than three hours from the meridian at *geocentric* conjunction, and that the sun is below the horizon.

The constants of the place are:

$\log \sin \varphi = 9.6984$	$\log \cos \varphi = 9.9377$	$\log F \cos \varphi = 9.9381$
$\log E = 9.9975$	$\log F = 0.0004$	$\log \mu' = 9.4192$
(1) $\log E \sin \varphi = 9.6959$	(2) $\log F \cos \varphi = 9.9381$	(3) $\log \mu' F \cos \varphi = 9.3573$

From page 418, we have for the time of *geocentric* conjunction

δ	$17^{\text{h}} 43.3^{\text{m}}$	$Y + .5398$	
$\delta - \lambda$	$16^{\text{h}} 51.5^{\text{m}}$	$z' + .5943$	$\delta' - 23^{\circ} 16'.9$
H	$1^{\text{h}} 56.2^{\text{m}}$	$y' - .0712$	$\log \sin \delta' = 9.5969 \pi$
$H - \lambda$	$2^{\text{h}} 48.0^{\text{m}}$		

1. For an approximation to the time of *apparent* conjunction, we have

(2) $\log F \cos \varphi = 9.938$	(3) $\log \mu' F \cos \varphi = 9.357$	
(4) $\log \sin (H - \lambda) = 9.826 \pi$	(5) $\log \cos (H - \lambda) = 9.871$	$z' = + .594$
(6)=(2)+(4) $\log u = 9.764 \pi$	(7)=(3)+(5) $\log u' = 9.228$	$u' = + .169$
(8) $\log (x' - u') = 9.638$		$z' - u' = + .425$
(6)-(8) $\log (t) = 0.136 \pi$		

$$(t) = -1.37 \quad \begin{matrix} \text{h} & \text{m} \\ - & 1 & 22.2 \end{matrix}$$

$$\delta = 17^{\text{h}} 43.3^{\text{m}}$$

$$\delta + (t) = 16^{\text{h}} 21.1^{\text{m}}$$

Washington mean time

2. Assuming this time, for which $t = (t) = -1^{\text{h}} 22.2^{\text{m}}$, we proceed as follows to find the times of immersion and emersion and the angles of position of the points of contact.

(9) $t = -1^{\text{h}} 22.2^{\text{m}}$	$\mu = -1^{\text{h}} 22.4^{\text{m}}$	(27) $z = +.5943$
(10) $H - \lambda = -2^{\text{h}} 48.0^{\text{m}}$		(28) $u' = +.1047$
(9)+(10) $k - \lambda = -4^{\text{h}} 10.4^{\text{m}}$		(29) $y' = -.0712$
		(30) $v' = +.0799$
(11) $\log \sin (k - \lambda) = 9.9483 \pi$	(27)-(28) $\pi \sin N = +.4896$	
(12)=(2) $\log F \cos \varphi = 9.9381$	(29)-(30) $\pi \cos N = -.1511$	
(13) $\log \cos (k - \lambda) = 9.6629$	(31) $\log m \sin M = 8.6493 \pi$	
(14) $\log \sin \delta' = 9.5969 \pi$	(32) $\log m \cos M = 8.3729$	$M = 297^{\circ} 53'$
(11)+(12) $\log u = 9.8864 \pi$	(33) $\log \tan M = 0.2764 \pi$	
(15) $\log u' = 9.4192$	(34) $\log \cos M = 9.6699$	
(16)=(12)+(13) $\log A \cos B = 9.6010$	(35) $\log \pi \sin N = 9.6898$	
(17)=(1) $\log A \sin B = 9.6959$	(36) $\log \pi \cos N = 9.1793 \pi$	
(16)-(17) $\log \cotan B = 9.9051$	(37) $\log \cotan N = 9.4895 \pi$	$N = 107^{\circ} 9'$
(18) $\log \sin B = 9.8018$	(38) $\log \sin N = 9.9803$	$M - N = 190^{\circ} 44'$
(19)=(17)-(18) $\log A = 9.8041$		
(20) $\log \sin (B - \delta') = 9.9839$	(39)=(32)-(34) $\log m = 8.7030$	(39) $\log m = 8.7030$
(19)+(20) $\log v = 9.7880$	(40) <i>Constant</i> , $\log \frac{1}{k} = 0.5650$	(42)=(38)-(35) $\log \frac{1}{\pi} = 0.2905$
(21) $t z' = -1.37 \times .5943 \quad z = -.8144$	(41) $\log \sin (M - N) = 9.2701 \pi$	(43) $\log \cos (M - N) = 9.9923 \pi$
(22) $u = -.7698$	(39)+(40)+(41) $1. \cos \psi = 8.5381 \pi$	(44) $1. \frac{m}{\pi} \cos (M - N) = 8.9858 \pi$
(23) $Y = +.5398$		
(24) $t y' = -1.37 \times -.0712 = +.0975$	(45) $\psi = + 91^{\circ} 59'$	(47) $\log \sin \psi = 9.9997$
(25)=(23)+(24) $y = +.6373$	(46) $N - 90^{\circ} = + 17^{\circ} 9'$	(42)-(40) $\log \frac{k}{\pi} = 9.7255$
(26) $v = +.6137$		
(21)-(22) $m \sin M = -.0446$	$N - 90^{\circ} + \psi$, at Im. $Q_1 = 109^{\circ} 8'$	(48) $\log \frac{k}{\pi} \sin \psi = 9.7252$
(25)-(26) $m \cos M = +.0236$	$N - 90^{\circ} - \psi$, at Em. $Q_2 = 285^{\circ} 10'$	(49) $-\frac{m}{\pi} \cos (M - N) = +0^{\text{h}}.097$
		(50) $\frac{k}{\pi} \sin \psi = +0^{\text{h}}.531$

For *Immersion*.

$$\begin{aligned}
 (51)-(49)-(50) \quad t_1 &= -0.434 \quad = -0^{\text{h}} 26.0^{\text{m}} \\
 \phi + (t) - \lambda = T &= 15^{\text{h}} 29.3^{\text{m}} \\
 \text{Local mean time, } T_1 = T + t_1 &= 15^{\text{h}} 3.3^{\text{m}}
 \end{aligned}$$

$$\begin{aligned}
 (51)-(49)-(50) \quad t_2 &= -0.403 \\
 (51) \times (28) &= -.434 \times .105 \quad t_1 u' = -.046 \\
 (22) \quad u &= -.770 \\
 u + t_1 u' \quad c_1 \sin C_1 &= -.816 \\
 (51) \times (30) \quad t_1 v' &= -.035 \\
 (26) \quad v &= +.614 \\
 v + t_1 v' \quad c_1 \cos C_1 &= +.579 \\
 \log c_1 \sin C_1 &= 9.912 \pi \\
 \log c_1 \cos C_2 &= 9.763 \\
 \log \tan C_1 &= 0.149 \pi \\
 C_1 &= 305.4^{\circ} \\
 \text{Angle from N. P., } Q_1 &= 109.1 \\
 \text{Angle from Vertex, } Q_1 - C_1 = V_1 &= 163.7
 \end{aligned}$$

For *Emersion*.

$$\begin{aligned}
 (52)-(49)+(50) \quad t_2 &= +0.628 \quad = +0^{\text{h}} 37.7^{\text{m}} \\
 T &= 15^{\text{h}} 29.3^{\text{m}} \\
 T_2 = T + t_2 &= 16^{\text{h}} 7.0^{\text{m}}
 \end{aligned}$$

$$\begin{aligned}
 (52)-(49)+(50) \quad t_2 &= +0.628 \\
 (52) \times (28) &= +.628 \times .105 \quad t_2 u' = +.066 \\
 (22) \quad u &= -.770 \\
 u + t_2 u' \quad c_2 \sin C_2 &= -.704 \\
 (52) \times (30) \quad t_2 v' &= +.050 \\
 (26) \quad v &= +.614 \\
 v + t_2 v' \quad c_2 \cos C_2 &= +.664 \\
 \log c_2 \sin C_2 &= 9.848 \pi \\
 \log c_2 \cos C_3 &= 9.822 \\
 \log \tan C_2 &= 0.026 \pi \\
 C_2 &= 313.3^{\circ} \\
 Q_2 &= 285.2 \\
 Q_2 - C_2 = V_2 &= 331.9
 \end{aligned}$$

We have also as a *Check*,

$$[(x-u) + t(x'-u')]^2 + [(y-v) + t(y'-v')]^2 = .0741 \quad .0741$$

3. Assuming now T_1 for the immersion and T_2 for the emersion as corrected values of the local time, T , we can obtain a nearer approximation. Instead, however, of an entire recomputation, a partial revision may be made like the following, for correcting the computed time and the angles of position for the emersion, using the values of M , $\log m$, t_2 , and C_n from the preceding computation.

$$\begin{aligned}
 (9) \quad \frac{1}{2} t_2 &= +0^{\text{h}} 18.8^{\text{m}} \quad \frac{1}{2} \mu = +0^{\text{h}} 18.9^{\text{m}} \\
 (10) \quad h - \lambda &= -4^{\text{h}} 10.4^{\text{m}} \\
 (9)+(10) \quad h_2 - \lambda &= -3^{\text{h}} 51.5^{\text{m}} \\
 (11) \quad \log \sin (h_2 - \lambda) &= 9.9278 \pi \\
 (12)=(2) \quad \log F \cos \phi &= 9.9381 \\
 (13) \quad \log \cos (h_2 - \lambda) &= 9.7257 \\
 (14) \quad \log \sin \delta' &= 9.5969 \pi \\
 (11)+(12) \quad \log u &= 9.8659 \pi \\
 (15) \quad \log u' &= 9.4192 \\
 (16)=(12)+(13) \quad \log A \cos B &= 9.6638 \\
 \log u' &= 9.8820 \\
 \log u &= 9.0830 \\
 (39) \quad \log m &= 8.7030 \\
 (40) \quad \log \frac{1}{k} &= 0.5650 \\
 (41) \quad \log \sin (M-N) &= 9.2640 \pi \\
 (39)+(40)+(41) \quad \log \psi &= 8.5320 \pi \\
 (45) \quad \psi &= 91^{\circ} 57' \\
 (46) \quad N - 90^{\circ} &= 17^{\circ} 21' \\
 \text{Angle from North Point, } Q_2 &= 285^{\circ} .4 \\
 (46)-(45) \quad Q_2 - C_2 &= 332^{\circ} .1 \\
 \text{Angle from Vertex, } Q_2 - C_2 &= 332^{\circ} .1 \\
 (27) \quad x' &= +5.043 \\
 (28) \quad u' &= +.1211 \\
 (29) \quad y' &= -.0712 \\
 (30) \quad v' &= +.0762 \\
 (33)=(27)-(28) \quad n \sin N &= +.4732 \\
 (34)=(29)-(30) \quad n \cos N &= -.1474 \\
 (35) \quad \log n \sin N &= 9.6751 \\
 (36) \quad \log n \cos N &= 9.1685 \pi \\
 (37) \quad \log \tan N &= 0.5066 \pi \\
 (38) \quad \log \sin N &= 9.9798 \pi \\
 M &= 297^{\circ} 53' \\
 N &= 107^{\circ} 18' \\
 M - N &= 190^{\circ} 35' \\
 (52)-(49)+(50) \quad t_2 &= +.6490 \\
 (53) \quad t_2 n \sin N &= +.3071 \\
 (27) \quad m \sin M &= -.0446 \\
 (54)=(27)+(53) &= +.2625 \\
 (55) \quad t_2 n \cos N &= -.0956 \\
 (28) \quad m \cos M &= +.0236 \\
 (56)=(28)+(55) &= -.0720 \\
 [54]^2 &= .0689 \\
 [56]^2 &= .0052 \\
 \text{Check, } [54]^2 + [56]^2 &= k^2 = +.0741 \\
 (49) \quad -\frac{m}{n} \cos (M-N) &= +.1001 \\
 (50) \quad \frac{k}{n} \sin \psi &= +.5489 \\
 t_2 &= +0.6594 = +0^{\text{h}} 38.9^{\text{m}} \\
 T &= 15^{\text{h}} 29.3^{\text{m}} \\
 T = T + t_2 &= 16^{\text{h}} 8.2^{\text{m}}
 \end{aligned}$$

Local mean time,

Jupiter's Satellites, pages 457–477. These pages contain for the several Satellites—

1. The Washington mean times of the occultations, eclipses, transits and transits of shadows, arranged in the order of time. Those visible at Washington, or which occur when the sun is more than 8° below and Jupiter more than 8° above the horizon of that place, are indicated by a *.

2. A diagram for each month, constructed for the eclipse which occurs nearest the middle of the month, showing the phases of the eclipse for an inverting telescope. The stars indicate the points of disappearance and reappearance, distinguished by d and r . The space between them shows the position of the shadow of the planet.

3. Washington mean times of geocentric superior conjunctions, arranged for each satellite separately.

4. The rectangular coördinates x' and y' , for successive times reckoned from the next preceding superior conjunction, computed for a constant major axis and maximum minor axis of the apparent ellipse described by the satellite as seen from the sun at its mean distance from the planet.

5. The *factors* by which x' and y' are to be multiplied to obtain the actual coördinates x and y for the apparent ellipse, as seen from the earth at any date; the inclination p of the minor axis to the circle of declination, reckoned from the *north*, positive towards the *east*; and the actual coördinates x and y at the times of eclipse of each satellite.

The coördinates are referred to the centre of the primary and to the major and minor axes of the ellipse described by the satellite, and are expressed in seconds of arc. x is positive when on the *east* side of the planet; y is positive when *north*. By means of them the configurations of the satellite can be found at any time.

The *Elements of Saturn's Ring*, page 478, give the *apparent* magnitude and position of its several components for each 20 days. The *apparent Discs of Venus and Mars* are given on the same page for each 30 days.

The *Phenomena*, pages 479 and 480, include the times of conjunction, opposition and quadrature, perihelion and aphelion, stationary points and conjunction, with the moon in right ascension of the principal planets.

The *Positions of the Principal Observatories* are given on pages 481 and 482. The list has been considerably enlarged, and the longitudes have been revised. The principal authority for the Continental Observatories of Europe has been the *Astronomisches Jahrbuch* for 1880. The positions of American Observatories have been corrected from the results of the most recent available determinations.

APPENDIX.

CONSTRUCTION OF THE ASTRONOMICAL AND NAUTICAL EPHEMERIDES FOR 1881.

THE Precession of the Equinoxes, the Mean Obliquity of the Ecliptic, and the Constant of Aberration (page 248) are taken from STRUVE and PETERS. They are :

$$\text{Precession}^* = 50''.2411 + 0''.0002268 t,$$

$$\text{Obliquity}^\dagger = 23^\circ 27' 54''.22 - 0''.4645 t - 0''.0000014 t^2,$$

$$\text{Aberration}^\ddagger = 20''.4451 \pm 0''.0111,$$

in which t is the number of years after 1800.

The Nutation of the Apparent Obliquity and the Equation of the Equinoxes are computed from PETERS' formulæ given in his *Numerus Constans Nutationis*, pp. 46-48, and reprinted in the volume of this Ephemeris for 1855. These quantities have been used in all computations relating to the Fixed Stars.

In the Ephemerides of the Sun, Moon, and Planets, the Obliquity of the Ecliptic and the Nutation of HANSEN and OLUFSEN's *Tables du Soleil* have been used ; but the same Constant of Aberration as for the fixed stars. The Mean Obliquity exceeds that of PETERS by $0''.32$.

The General Constants for Star Reduction are adapted to the formulæ given on page 258. They are computed from the *Tables to facilitate the Reduction of Places of the Fixed Stars, prepared for the use of the American Ephemeris and Nautical Almanac*, Washington, 1869, which have been used in the preparation of previous volumes of this work subsequent to that of 1861.

The right ascensions of the 48 circumpolar stars north of $+64^\circ$ north declination are from Dr. GOULD's *Standard Places of Fundamental Stars*, second edition, U. S. Coast Survey Office, 1866. Tables of mean places are found in the *Star Tables* above quoted. The right ascensions of the stars between $+64^\circ$ and -50° are from an unpublished investigation, except that the places of such of the 36 Maskelyne fundamental stars, as are found in Appendix III to the *Washington Observations* for 1870, are taken from that work. Of the 12 stars south of -50° , the positions of β Hydri, α Trianguli Australis, and σ Octantis, have been corrected from data furnished by Dr. GOULD, while the remaining 9 are, as before, from the *British Nautical Almanac* for 1848.

The declinations are all from Boss's paper on the declinations of 498 standard stars, now in press, except in the case of 9 stars now added for the first time, of which the declinations have been investigated anew, and reduced to Boss's standard.

* PETERS' *Numerus Constans Nutationis*, p. 71.

† Ibid., pp. 66 and 71.

‡ STRUVE'S *Constant de l'Aberration*, p. 47.

APPENDIX.

To the apparent places of Sirius and Procyon have been applied the periodic corrections resulting from AUWERS's investigations. The values of these corrections are:—

	SIRIUS.		PROCYON.	
1881.0	$\Delta \alpha = -.067$	$\Delta \delta = -1.45$	$\Delta \alpha = -.045$	$\Delta \delta = +0.80$
1882.0	— .052	— 1.44	— .036	+ 0.90

The mean places of the moon-culminating stars, and of stars which may be occulted by the moon, have been derived from the best recent authorities.

The Ephemeris of the Sun* is constructed from HANSEN and OLUFSEN's *Tables du Soleil*, Copenhagen, 1853, except that STRUVE's aberration has been used. This is equivalent to adding 0".19 to the longitudes, but does not affect the right ascensions and declinations. The Sun's rectangular equatorial coördinates have been computed from the longitudes and latitudes by the following formulæ:

$$\begin{aligned} X &= R \cos \lambda \\ Y &= R \sin \lambda \cos \omega - 19.3 R \beta \\ Z &= R \sin \lambda \sin \omega + 44.5 R \beta \\ X' &= X + Y \sec \omega \Delta \lambda \\ Y' &= Y - X \cos \omega \Delta \lambda + Z \Delta \omega - 9.4 \tau R \sin (\odot + 187^\circ) \\ Z' &= Z - X \sin \omega \Delta \lambda - Y \Delta \omega + 21.7 \tau R \sin (\odot + 187^\circ) \end{aligned}$$

in which λ and β are the longitude and latitude of the sun referred to the equinox and ecliptic of the date; ω is the obliquity of the ecliptic; $\Delta \lambda$ the reduction of longitude for precession and nutation from January 0; $\Delta \omega$ the reduction of the mean to the apparent obliquity; τ the part of the year since January 0; and the numerical coefficients are in units of the 7th place of decimals. The correction for latitude has been taken from GOETZE's paper in the *Astron. Journal*, Vol. II, p. 71.

The mean equatorial Horizontal Parallax of the Sun, adopted from Prof. NEWCOMB's *Investigation of the Distance of the Sun and the Elements which depend on it*,† is 8".848. The adopted Semidiameter of the Sun at the Earth's mean distance is 16' 2".

The Ephemeris of the Moon is constructed from PEIRCE's *Tables of the Moon*, 2d edition, Washington, 1865. They include the *Tables of the Moon's Parallax* constructed from WALKER's and ADAMS's formulæ.

The Semidiameter of the Moon is computed from the Moon's Horizontal Parallax by the formula,

$$S = .272274 \pi + 2''.5.$$

A semidiameter 2''.5 less is found to be better adapted for the computation of eclipses and occultations.

The Ephemeris of Mercury is derived from Prof. WINLOCK's *Tables of Mercury*, Washington, 1864. They are based on the theory of LE VERRIER, published in the *Additions to the Connaissance des Temps* for 1848.

The Ephemeris of Venus is derived from Mr. G. W. HILL's *Tables of Venus*, Washington, 1872.

The Ephemeris of Mars is derived from manuscript Tables constructed from LINDENAU's Tables. Mr. HUGH BREEN's results, contained in his paper *On the Corrections of LINDENAU's Elements of Mars*, published in the *Memoirs of the Royal Astronomical Society*, Vol. XX., have also been discussed and applied; and LE VERRIER's secular variations

* From CARLINI's Tables before 1858.

† *Astronomical Observations made at the U. S. Naval Observatory, Washington, 1865, Appendix II.*

CONSTRUCTION OF THE ALMANAC.

of the elements are likewise adopted. The following are the corresponding corrected elements, and annual variations for Washington, 1855.0:

$$\begin{aligned} L &= 320^{\circ} 13' 33.87 + 689101''.1527 t. \\ \pi &= 333 23 17.84 + 65''.9990 t. \\ \Omega &= 48 25 55.29 + 27''.6997 t. \\ i &= 1 51 2.20 - 0''.02141 t. \\ e &= 19238''.75 + 0''.18549 t. \\ n &= 689050''.8927 \\ a &= 1.5236915 \end{aligned}$$

The Ephemeris of Jupiter is derived from manuscript Tables constructed from BOUVARD's Tables, with such changes as were required to make them correspond more nearly to the formulæ.

The Ephemeris of Saturn is derived from BOUVARD's Tables. The perturbations produced by Jupiter, and the change of the Great Inequality since 1840, have been increased by $\frac{1}{10}$ of their value. ADAMS's Table, in the *British Nautical Almanac* for 1851, has been substituted for BOUVARD's Table XLII. The following corrections of the elements for 1855.0 have also been introduced:

$$\begin{aligned} \text{corr. mean long.} &= + 4''.9 \\ \text{corr. long. of node} &= - 143''.0 \\ \text{corr. inclination} &= - 5''.7 + 0''.0149 t. \end{aligned}$$

The Ephemeris of Uranus is derived from Prof. NEWCOMB's *Tables of Uranus*, Washington, 1873.

The Ephemeris of Neptune is derived from Prof. NEWCOMB's *Tables of Neptune*, Washington, 1866.

The eclipses of Jupiter's Satellites are computed from TODD's *Continuation of DAMOISEAU's Tables*, Washington, 1876.

The semidiameters of the Planets are computed from the following values:

	Semidiameter.	Log Dist.	Authority.
Mercury	3.34	0.00	LE VERRIER, <i>Theory of Mercury</i> .
Venus	8.546 ± 0.086	0.00	PEIRCE, from the Washington Observations of 1845 and 1846, made with the mural circle.
Mars (polar)	2.842 ± 0.057	0.25	
Jupiter (polar)	18.78 ± 0.067	0.70	
Saturn (polar)	8.77 ± 0.039	0.95	
Uranus	1.68 ± 0.3	1.30	
Jupiter (equat.)	20.00	0.70	
Saturn (equat.)	9.38	0.95	

The apparent elements of Saturn's Rings are computed from BESSEL's data, except those for BOND's dusky ring.

The Tables for the eclipses of the sun are adapted to the modification of BESSEL's formulæ, suggested by T. HENRY SAFFORD, jr. The formulæ are given in PEIRCE's *Spherical Astronomy* and CHAUVENET's *Spherical and Practical Astronomy*, Vol. I.

The elements for occultations of stars by the moon are adapted to BESSEL's method in the *Astronomische Nachrichten*, Vol. VII., and the *Berliner Astronomisches Jahrbuch* for 1831. The formulæ are also to be found in CHAUVENET's *Astronomy*.

The intervals of original computation have in all cases been made sufficiently small to authorize the use of the differences as a check of the accuracy of the work. The results have also been tested, in various portions, by means of duplicate computations. The proofs from the stereotype plates have been thoroughly examined by an independent series of differences.

APPENDIX.

The principal computations of the Ephemeris have been distributed in the following manner:

The Sun has been computed by Mr. EASTWOOD; the Moon's longitude, latitude, semi-diameter and horizontal parallax, by Prof. KEITH; right ascension and declination, by Prof. VAN VLECK; and culminations, by Prof. RUNKLE; the lunar distances, by Mr. W. B. OLIVER; Mercury and Venus, by Mr. AUSTIN; Mars and Uranus, by Mr. FERREL; Jupiter and Jupiter's Satellites, by Prof. KENDALL; Saturn, by Mr. G. W. HILL; and Neptune, by Mr. WIESSNER; the fixed stars have been prepared by Mr. WIESSNER, Mr. LOOMIS, and Dr. TOWNSEND; the general constants for their reduction, by Mr. FERREL; and the occultations, by Mr. DOWNES assisted by Mr. WIESSNER; the eclipses have been computed and the charts projected by Mr. HILL.

SUPPLEMENT.

SUPPLEMENT TO THE AMERICAN EPHEMERIS AND NAUTICAL ALMANAC,

FOR THE YEARS

1878, 1879, 1880, and 1881.

TABLES FOR FINDING THE LATITUDE OF A PLACE BY ALTITUDES OF POLARIS.

The formula* on which these tables are based is:

$$L = h - p \cos t + \frac{1}{2} p^2 \sin 1'' \sin^2 t \tan h \\ - \frac{1}{6} p^3 \sin^2 1'' \cos t \sin^2 t + \frac{1}{24} p^4 \sin^3 1'' \sin^4 t \tan^3 h;$$

in which

L = the latitude of the place, and

h = the true altitude,

p = the polar distance, and

t = the hour angle of the star.

Table A contains for the declination $88^\circ 40'$, or $p_0 = 1^\circ 20' = 4800''$, the *first correction*,

$$A = -p_0 \cos t - \frac{1}{2} p_0^2 \sin^2 1'' \cos t \sin^2 t;$$

Argument, *the hour angle of the star*, or 24^h — the hour angle.

Table B contains the *second correction*,

$$B = \frac{1}{2} p_0^3 \sin 1'' \sin^2 t \tan h + \frac{1}{24} p_0^4 \sin^3 1'' \sin^4 t \tan^3 h;$$

Arguments, *the true altitude of the star* and *the hour angle*, or 24^h — the hour angle. This correction is always *additive*.

Table C contains the *third correction*,

$$C = \frac{1}{2} (p^3 - p_0^3) \sin 1'' \sin^2 t \tan h;$$

Arguments, B and *the declination of the star* from $88^\circ 39' 20''$ to $88^\circ 41' 20''$.

Table D contains the *fourth correction*,

$$- (p - p_0) \cos t - \frac{1}{6} (p^3 - p_0^3) \sin^2 1'' \cos t \sin^2 t;$$

Arguments, A and *the declination of the star* from $88^\circ 39' 20''$ to $88^\circ 41' 20''$.

The quantities are given to the nearest $0''.1$: a . placed after some of them indicates a doubt between the figure given and the next highest, or that the correct value is $0''.05$ greater than that given. Thus, $3''.7$. indicates the actual value $3''.75$.

The method of using these tables is as follows:

Reduce the observed altitude of the star to the true altitude, and the noted time of the observation to the sidereal time of the place.

Find from the Ephemeris the apparent right ascension and declination of the star at the time of observation.†

* CHAUVENET'S *Spherical and Practical Astronomy*, Vol. I., p. 256.

† If great precision is aimed at, the tables in the Ephemeris may be interpolated for the hour angle at the prime meridian, i. e., the local hour angle + the longitude; (west longitudes being regarded as positive.) The solar date, with which to enter, will be one day *later* than the astronomical day of observation in the case of a *west* hour angle, which added to the mean time of culmination gives more than 24^h or 1^d ; and one day *earlier* in the case of an *east* hour angle, which is numerically greater than the mean time of culmination. In the American Ephemeris the mean time of culmination is given to tenths of a day.

LATITUDE BY ALTITUDES OF POLARIS.

Subtracting the right ascension from the sidereal time will give the star's hour angle west or +; subtracting the sidereal time from the right ascension will give the hour angle east or -. If it is more than 12^h, subtract it from 24^h and change the sign.

1. With this hour angle take out the *first correction*, *A*, from Table A, giving to it the sign - when the hour angle is numerically less than 6^h; the sign + when the hour angle is greater than 6^h.

2. With the hour angle and altitude take out the *second correction*,* *B*, from Table B. The sign of this correction is always +.

3. With *B* and the declination take out the *third correction*, *C*, from Table C, giving it the sign + when the declination is less than 88° 40'; - when the declination is greater than 88° 40'.

4. With *A* and the declination take out the *fourth correction*, *D*, from Table D, giving it the same sign as that of *A*, when the declination is less than 88° 40'; the opposite sign when the declination is greater than 88° 40'.

5. Combine these corrections with the true altitude according to their signs: the result is the latitude of the place of observation.

When great precision is required, or the intervals are great, it will be necessary to take out the *first* and *second corrections* for each observation separately; in other cases, the mean of the times may be used. The means of these two corrections may always be used for finding the *third* and *fourth corrections*; and these four quantities may be combined with the mean of the altitudes.

If the nearest 10'' suffices for each correction, they may be taken out with the nearest arguments without interpolation; and all but the *first* may be thus taken out when a precision of 3'' is required.

If a precision of 1' is sufficient for each correction, as is ordinarily the case at sea, an hour angle within 3^m will suffice for Table A; Tables C and D may be neglected, and Table B used only when the altitude exceeds 47°.

Example.—1881, November 10, 9^h 54^m 48.6, p. m., mean time, in longitude 25° West of Washington, suppose the corrected altitude of Polaris to be 25° 25' 25'', required the latitude of the place.

Local astronomical mean time,	November 10, 9 ^h 54 ^m 48.6
Reduction for 9 ^h 54 ^m 48.6, Appendix, Table III,	+ 0 1 37.7
Washington sidereal time of mean noon, (page 331),	15 19 58.1
Reduction for longitude (= + 1 ^h 40 ^m), Appendix, Table III,	+ 0 0 16.4
Sum equals local sidereal time,	1 16 40.8
Page 265, Polaris, app. decl. = + 88° 40' 59''.6	App. R. A. 1 16 30.8
Difference equals hour-angle,	+ 0 0 10.0

The local astronomical mean time of observation equals November 10.5, Washington mean time, for which epoch the apparent place of Polaris is interpolated.

Corrected altitude,	+ 25° 25' 25.0
Table A, corresponding to the hour-angle,	<i>A</i> = - 1 20 0.0
Table B, corresponding to the altitude and hour-angle,	<i>B</i> = 0 0 0.0
Table C, corresponding to the declination and <i>B</i> ,	<i>C</i> = 0 0 0.0
Table D, corresponding to the declination and <i>A</i> ,	<i>D</i> = + 0 0 59.6
Sum equals latitude,	+ 24 6 24.6

* If the altitude is greater than 60°, this correction may be found by taking that for 45° and multiplying it by the tangent of the altitude; adding, if desirable, the second term in the expression for *B*, viz: + 0''.0076 sin⁴ *t* tan³ *h*.

FOR FINDING THE LATITUDE OF A PLACE BY ALTITUDES OF POLARIS.

Change the sign to + when the argument is found at the bottom.

TABLE B.

FOR FINDING THE LATITUDE OF A PLACE BY ALTITUDES OF POLARIS.

B = the 2d correction. This correction is always additive.
